The American chestnut whitebark pine and several species of ash in the eastern United States are just a few of the North American tree species that have been functionally lost or are in jeopardy of being lost due to outbreaks of pathogens and insect pests New pressures in this century are putting even more trees at risk Expanded human mobility and global trade are providing pathways for the introduction of nonnative pests for which native tree species may lack resistance At the same time climate change is extending the geographic range of both native and nonnative pest species Biotechnology has the potential to help mitigate threats to North American forests from insects and pathogens through the introduction of pest resistant traits to forest trees However challenges remain the genetic mechanisms that underlie trees resistance to pests are poorly understood the complexity of tree genomes makes incorporating genetic changes a slow and difficult task and there is a lack of information on the effects of releasing new genotypes into the environment Forest Health and Biotechnology examines the potential use of biotechnology for mitigating threats to forest tree health and identifies the ecological economic and social implications of deploying biotechnology in forests This report also develops a research agenda to address knowledge gaps about the application of the technology *Biotechnology And Plant Protection: Bacterial Pathogenesis And Disease Resistance - Proceedings Of The Fourth International Symposium* Donald D Bills, Shain-dow Kung, 1994-07-27

An important aspect of successful agriculture is the control of plant diseases that reduce productivity quality and profitability Application of exogenous chemicals and development of endogenous resistance are two general approaches to controlling plant diseases As the former falls under continued attack and regulation the latter fortunately becomes more achievable through biotechnology Biotechnology and Plant Protection Bacterial Pathogenesis and Disease Resistance explores the application of biotechnology to understanding bacterial pathogenesis and the nature of plant resistance to bacterial disease More important the information presented in this volume foreshadows the development of plants with increased native resistance to bacterial disease Classical plant breeding has made great progress in developing resistant plants through largely empirical approaches but a direct understanding of the genetic aspects of pathogenesis and resistance will accelerate the process
