## **Biological Horizons In Surface Science:**

Biological Horizons in Surface Science L Prince, 2012-12-02 Biological Horizons in Surface Science presents techniques used in surface science research as well as experimental data. It is organized in such a way that there is a transition from the more theoretical or molecular to the more biological. Emphasis is placed on the importance of water in determining molecular architecture and interactions. Methods of examining molecular associations and complex formation of molecules are discussed and the results from such studies are reviewed. Permeability is examined from the point of view of the energies required to penetrate between two different phases and from the role that multicellular membranes may play in directing the diffusion of ions or solutes in general. Current concepts of membrane structure based on membrane models are discussed and some new models are suggested. Application of surface science techniques and the unique energies present at interphases are considered with regard to drug interaction with biological tissue and immunological phenomena. The importance of surfactant protein lipid association is also discussed in regard to alveolar mechanics. This book is directed particularly to biologists who will find many of the techniques used of significance in their own research. It also aims to interest graduate students in this area of investigation. **National Library of Medicine Current Catalog** National Library of Medicine (U.S.), 1974 First multi year cumulation covers six years 1965-70

**Surface and Interfacial Aspects of Biomedical Polymers** J.D. Andrade, 2012-12-06 This book is intended to provide a fundamental basis for the study of the interaction of polymers with living systems, biochemicals and with aqueous solutions. The surface chemistry and physics of polymeric materials is a subject not normally covered to any significant extent in classical surface chemistry textbooks. Many of the assumptions of classical surface chemistry are invalid when applied to polymer surfaces. Surface properties of polymers are important in the development of medical devices and diagnostic products. Surface properties are also of vital importance in fields such as adhesion, paints and coatings, polymer filler interactions, heterogeneous catalysis, composites and polymers for energy generation. The book begins with a chapter considering the current sources of information on polymer surface chemistry and physics. It moves on to consider the question of the dynamics of polymer surfaces and the implications of polymer surface dynamics on all subsequent characterization and interfacial studies. Two chapters are directed toward the question of model polymers for preparing model surfaces and interfaces. Complete treatments of X-ray photoelectron spectroscopy and attenuated total reflection infrared spectroscopy are given. There is a detailed treatment of the contact angle with particular emphasis on contact angle hysteresis in aqueous systems, followed by chapters on interfacial electrochemistry and interface acid-base charge transfer properties. The very difficult problem of block and graft copolymer surfaces is also discussed. The problem of theoretical calculations of surface and interfacial tensions is presented. Raman spectroscopy is considered as an analytical technique for polymer surface characterization. *Medical Applications of Liposomes* D.D. Lasic, D. Papahadjopoulos, 1998-07-22 The development of liposomes as a drug delivery system has fluctuated

since its introduction in the late 1960 s by A D Bangham While academic research of liposomes as a model membrane system has always flourished as the exponential growth of papers can testify the application of these findings to medically useful products has gone through several crises Following the original optimism in the 70 s and early 80 s a period of severe skepticism ensued at the end of the 80 s and beginning of the 90 s culminating in a moderate but real optimism in the mid 90 s as a result of a successful launch of the first products in the US and Europe In this collection of papers the editors have gathered the most promising ideas approaches applications and commercial developments thereby presenting an up to date compilation of the present status of the field This includes such broad areas as anti cancer chemotherapy immune stimulation and infectious diseases Currently the major areas of progress are in delivery of anti fungal agents by conventional liposomes or lipid based carriers and systemic anticancer therapy using long circulating liposomes The future applications as characterized by the direction of present day research is in specific targeting and delivery of informational molecules such as DNA plasmids genes antisense oligonucleotides or ribozymes Other future developments may be in topical delivery vaccination and in diagnostics Features of this book Contributions from almost all the leading labs in the field Up to date critical reviews bridged by editors introductions Organized into a logical framework *Catalog of Copyright Entries.
