**Carbohydrates and Nucleic Acids** Lawrence J. Berliner, Jacques Reuben, 2013-06-29 In the past ten years or so biological magnetic resonance NMR and ESR has fully blossomed and become highly branched In the 1970s and earlier a practitioner in biological magnetic resonance was using virtually all of the available methods suitable for his research with the latter covering a diverse range of systems Today the focus of an individual laboratory is actually much narrower with respect to both the methods and the systems investigated Thus those who investigate protein structure by multi dimensional NMR spectroscopy do not usually engage in studies involving in vivo spectroscopy The conferences on biological magnetic resonance now have parallel sessions rather than the single common session of earlier days Moreover topical meetings are becoming more frequent Therefore this and future volumes of our series will also focus on specific topical areas We are proud to present Volume 10 of our series It focuses on Carbohydrates and Nucleic Acids In an extensive chapter Kamerling and Vliegenthart use oligosaccharide alditols released from mucin type glycoproteins to illustrate the power of proton NMR spectroscopy in the determination of carbohydrate structure Wemmer gives a detailed coverage of the arsenal of modern NMR methods now available for structural studies of nucleic acids Forthcoming volumes will focus on In Vivo Spectroscopy and Protein Structure As always we are anxious to get feedback from the readers and hear their comments and suggestions

Lawrence J     Bulletin of Magnetic Resonance ,1994     *Bioinformatics for Glycobiology and Glycomics* Claus-Wilhelm von der Lieth, Thomas Luetkeke, Martin Frank, 2009-10-01 This book is the first to be dedicated to the bioinformatics of carbohydrates and glycoproteins It provides an introduction to this emerging field of science both for the experimentalist working in glycobiology and glycomics and also for the computer scientist looking for background information for the development of highly sophisticated algorithmic approaches The book provides an overview of the state of the art in the field with reviews on databases and the tools in use for analysis interpretation and prediction of the structures of complex carbohydrates and demonstrates the value of bioinformatics for glycobiology The availability of comprehensive databases and corresponding bioinformatics tools to access and analyse the large amounts of experimental data relating to the structure of carbohydrates will be a prerequisite for the success of the large scale glycomics projects that aim to decipher new so far unknown biological functions of glycans Efficient bioinformatics descriptions and tools can considerably enhance the efficiency of glycomics research in terms of data quality analysis and experimental costs For a complete understanding of the molecular processes in which carbohydrates are involved such as protein carbohydrate interactions and the impact of glycosylation on protein function knowledge of the 3D structure of the carbohydrate the protein carbohydrate complex or the glycoprotein is often indispensable This book provides a thorough introduction into methods used for conformational analysis of carbohydrates Key features Describes bioinformatic approaches to handle carbohydrate active enzymes and glycosylation Provides an overview on bioinformatics tools that facilitate analysis of carbohydrate structures Gives introduction into

molecular modelling of carbohydrate 3D structure and carbohydrates contained in the Protein Databank Assumes only a basic knowledge of biology and bioinformatics      **Carbohydrates and Nucleic Acids** Lawrence J. Berliner, Jacques Reuben, 1992-06-30 This latest volume of Biological Magnetic Resonance focuses on carbohydrates and nucleic acids especially the use of NMR spectroscopy in the determination of their structures      **Forthcoming Books** Rose Army, 1993-12

Orlov, Guoshuai Cai, 2025-06-17 With the recent development of sequencing technology and the rapid reduction of sequencing costs high throughput sequencing including second and third generation sequencing is revolutionizing basic life science research and clinical research from various aspects High throughput sequencing often produces millions of sequencing reads at a time and the alignment or assembly of these reads allows the determination of various mutations e g SNV and Indels at the genomic level accurate gene expression quantification at the transcriptomic level and identification of histone or DNA modification at the epigenomic level The resulting accumulation of enormous multi omics information has opened up a new era of finding effective disease markers and studying their roles in disease occurrence and development Using high throughput sequencing various markers of chronic diseases such as cancer heart disease diabetes and arthritis have been developed at all omics levels which have been used for diagnosis and classification of diseases prediction of treatment effects and prevention of diseases The quickly and massively acquired multi omics data together with newly developed algorithms provide an excellent chance for the identification of more reliable biomarkers This research topic aims at 1 developing new chronic disease markers at four levels i e genome epigenome transcriptome and translome with the help of high throughput sequencing and 2 delineating potential marker related mechanisms for chronic disease occurrence or development This research topic covers a broad spectrum of interests and studies including both wet lab and dry lab results are more welcomed More specifically this research topic welcomes contributions including but not limited to the following areas 1 Identification of novel biomarkers

for chronic disease detection especially in early stage or prognosis prediction using high throughput sequencing 2 characterize the possible pathological causes of markers as well as the potential roles they play in disease initiation and development 3 New high throughput sequencing techniques that facilitate the development of more effective biomarkers of chronic disease 4 New algorithms or tools for in silico identification of effective chronic disease markers based on high throughput sequencing data Please note that 1 the high throughput sequencing for genome epigenome transcriptome and translome i e ribosome associated RNA is preferred for this topic 2 at least some dry lab results need to be validated with wet lab experiments 3 studies successfully uncovering biomarker related disease mechanisms will be highly preferred
