Biology and Treatment of Dementia in the Elderly Charles A. Shamoian, 1984 National Library of Medicine Current Catalog National Library of Medicine (U.S.), **Current Catalog** National Library of Medicine (U.S.), First multi year cumulation covers six years 1965-70 **Biology of Cognitive Aging: Model Systems, Technologies and beyond** Shin Murakami, 2017-04-13 Welcome We humans tend to experience forgetfulness when we get old The forgetfulness may become more serious memory impairment dementia Presumably we have known it for a long time but we still do not know the mechanism behind A normal part of forgetfulness is called age related memory impairment AMI which is considered the first step towards mild cognitive impairment MCI transition state and dementia disease state The majority of dementia is attributable to Alzheimer's disease AD Progression to dementia occurs at a high rate in patients with AMI This eBook covers exciting but yet challenging field of cognitive aging AMI is specific to neural tissues of the brain and is considered to be segmental aging It happens not only to humans but also to a variety of species Learning and memory are vulnerable to aging in a wide variety of model species including worms fruit flies insects snails fishes and rodents Aging specifically reduces the ability to learn new information but leaves old memories and procedural memory intact A comparative approach including the use of model systems seems to facilitate understanding of the molecular mechanisms that lead to AMI and AD We advocate research on model systems This eBook also provides the first manuscript co authored with an AD patient to create a feedback loop from patients incorporated into research We also included a manuscript on the semi automated system that was inspired by such a feedback Those may place a nice flavor to this exciting series of comparative research on cognitive aging We hope you enjoy this eBook Warm regards Shin Murakami Ph D **Biological Basis of Geriatric Oncology** Lodovico Balducci, Martine Extermann, 2006-06-14 Biological Basis of Geriatric Oncology highlights research issues that are specific to geriatric oncology in the field of carcinogenesis and cancer prevention and treatment based on the biologic interactions of cancer and age It illustrates the benefit of the principles of geriatrics in the management of cancer in the older individual This volume provides a frame of reference for practitioners of any specialties involved in the management of older patients and for oncologists involved in the management of cancer of older individuals It is a source for basic and clinical scientists exploring the interactions and emerging information of cancer and aging *Handbook of the Biology of Aging* Edward J. Masoro, Steven N. Austad, 2010-12-13 Handbook of the Biology of Aging Seventh Edition reviews and synthesizes recent findings and discoveries in the field This volume is part of The Handbooks of Aging series which also includes The Handbook of the Psychology of Aging and The Handbook of Aging and the Social Sciences The book is organized into two parts Part 1 covers basic aging processes It covers concepts relevant to clinical research such as muscle adipose tissue and stem cells It discusses research on how dietary restriction can slow down the aging process and extend life in a wide range of species Part 2 deals with the medical physiology of aging It contains several chapters on the aging of the

human brain These chapters deal not only with diseases but also with normal aging changes to cerebral vasculature and myelination as well as the clinical implications of those changes Additional chapters cover how aging affects central features of human health such as insulin secretion pulmonary and cardiac function and the ability to maintain body weight and body temperature The volume is primarily directed at basic researchers who wish to keep abreast of new research outside their own subdiscipline It will also be useful to medical behavioral and social gerontologists who want to learn about the discoveries of basic scientists and clinicians Contains basic aging processes as determined by animal research as well as medical physiology of aging as known in humans Covers hot areas of research like stem cells integrated with longstanding areas of interest in aging like telomeres mitochondrial function etc Edited by one of the fathers of gerontology Masoro and contributors represent top scholars in gerontology

Chemical Biology of Neurodegeneration Pedro Merino, 2019-11-12
Bridges the gap between the chemistry of small molecule neuromodulators and the complex pattern of neurodegenerative disorders Written by an experienced neurochemist this book focuses on the main actors involved in neurodegenerative disorders at a molecular level and places special emphasis on structural aspects and modes of action Drawing on recent data on enzyme structure mode of action and inhibitor design it describes from a biochemical point of view the six most important neurotransmitter systems and their constituent enzymes and receptors Misfolding and aggregation of proteins within the brain is also covered In addition the book surveys a wide range of proven and prospective therapeutic agents that modulate key processes in the brain from their chemical synthesis to their mode of action in model systems as well as in the patient

Chemical Biology of Neurodegeneration A Molecular Approach is presented in two parts The first introduces the neurotransmitter systems and provides a general explanation of the synapse and a description of the main structures involved in neurotransmission that can be considered therapeutic targets for disorders of the central nervous system The second part presents molecular and chemical aspects directly involved or affected in neurodegeneration including the metabolism of neurotransmitters enzymes processing neurotransmitters protein misfolding and therapeutic agents Uses an interdisciplinary approach to bridge the gap between the basic biochemical events in a nerve cell and their neurological effects on the brain Places emphasis on the chemistry of small molecule modulators that are potential lead molecules for new drugs Covers six key neurotransmitter systems and their enzymes and receptors dopaminergic noradrenergic serotonergic cholinergic GABAergic and glutamatergic

Principles of Molecular Neurosurgery Andrew Freese, F.A. Simeone, P. Leone, C. Janson, 2005 The future of neurosurgery will be characterized by less invasive molecular technologies that promise to revolutionize the field of neurosurgery and impact the treatment of additional neurological disorders including neurometabolic diseases stroke dementias affective and psychiatric diseases movement disorders epilepsy and others This book encompasses developing an understanding of the principles

underlying the advent of novel molecular approaches to neurological and neurosurgical diseases It Identifies key principles that will allow dramatic improvement in the treatment and outcomes of patients suffering from a variety of disorders affecting the central nervous system and spinal axis This volume gives neurosurgeons an excellent understanding of the development of novel molecular and cellular technologies that will markedly change the way neurosurgery is practiced in the near future It is also of special interest to neurologists psychiatrists physiatrists spinal orthopaedic surgeons neurobiologists and gene therapy research scientists *Science Tracer Bullets: Medical and biological sciences* Helene Henderson,1990 Biology of Disease Nessar Ahmed,Chris Smith,Qiuyu Wang,2025-11-27 Praise for the First Edition An excellent introduction to the subject of pathology disease and laboratory diagnostics ideal for undergraduate students on biomedical science and related degrees Alison Cottell for Biochemistry and Molecular Biology Education When you first pick up this book and peruse the pages it is immediately encouraging The presentation and production values are very good the diagrams and photographs look professional and it is a substantial volume all of which suggests a worthwhile textbook I recommend this book to students and tutors as a text for any course on the biology of disease D J Cook for the British Journal of Biomedical Science Biology of Disease describes the biology of many of the human disorders and diseases that are encountered in a clinical setting Assuming no prior knowledge of the principles of diagnostic science chapters follow a consistent format Each opens with a set of learning objectives an introduction to the topic and a description of the relevant biochemistry molecular and cell biologies and physiology How this biology is altered during the development of diseases and their diagnoses management and treatment are then discussed Real cases are used to illustrate the importance of biology in understanding the causes of disease as well as in diagnosis and therapy This second edition has been thoroughly revised and updated throughout and is now presented in full colour with more case studies questions and illustrations Key Features Summarises the biological bases of common diseases Discusses real cases placing basic science in a clinical context for the student Includes learning objectives end of chapter summaries and questions for self testing Extensively illustrated in full colour with explanatory line diagrams and photographs Is associated with additional online resources for students and lecturers available for download at www.routledge.com/9781032284361 The second edition of Biology of Disease is primarily aimed at meeting the needs of both undergraduate and postgraduate students of the biomedical sciences However it will also be of utility to those studying topics related to medicine such as clinical sciences clinical physiology and health sciences It should also provide an effective reference for students beginning medical school The text will also interest students of biological sciences with a feel for clinical related aspects of their subject areas **Sirtuins in Biology and Disease** Tiago F. Outeiro,Aleksey G. Kazantsev, Sirtuins comprise a family of NAD dependent enzymes that have been shown to impact longevity in a number of eukaryotic organisms Sir2 Silent Information Regulator 2 was the first sirtuin protein discovered The discovery that Sir2 requires NAD for its activity suggested a link between Sir2 activity and the phenomenon of caloric restriction in prolonging longevity This

link was strengthened by the observation that lifespan extension by caloric restriction requires Sir2 protein. Under conditions of caloric restriction, NAD levels are high, Sir2 is activated, and the rate of aging is decreased. These effects have been replicated in invertebrate organisms where a close structural and functional homologue of Sir2 was found in *C. elegans* and *Drosophila*. The sirtuin-dependent effects on metabolism and ageing observed in lower organisms have ignited intensive investigation of their biological and therapeutic roles in mammals. There are seven known mammalian sirtuins, SIRT1-7, the most studied of which is SIRT1, a close structural and functional homologue of yeast Sir2. Enhancement of organismal longevity and other health-promoting effects of mammalian SIRT1 have frequently been attributed to the regulation of metabolism. A recognized molecular link between metabolism and aging stimulated a firestorm of investigations aiming to combat metabolic and age-dependent human diseases. It has become clear, however, that the sirtuin family of proteins regulates a diverse repertoire of cellular functions in mammals. Mounting evidence implicating SIRT1 in important clinical indications such as diabetes, cancer, cardiovascular dysfunction, and neurodegenerative disease suggest that sirtuin is an attractive therapeutic target. Subsequently, drug discovery and development targeting sirtuin activation has been intensified in the recent years. Despite rapid progress and accumulation of new data, the biological roles of other mammalian sirtuins have been less studied and remain poorly understood. There are several important questions that remain to be addressed: What are the functions of sirtuins in different cell types and tissues? Are all sirtuins involved in the regulation of metabolism and aging? What is the functional relationship between different sirtuins? What are the mechanisms of regulation of sirtuin activities? What is the role of sirtuins in disease and therapy? This issue aims to address these and other critical questions relevant to Research Topic on sirtuin biology and therapeutics. To that end, the issue solicits expert opinions of sirtuin research on structural biology, biochemistry, cell biology, animal genetics, pharmacology, medicinal chemistry, and drug discovery, and on areas of investigation studying human conditions like diabetes, cancer, cardiovascular, and neurodegeneration. Of particular interest are the new methods and assays to study sirtuins in various organisms and developing sirtuin-based therapeutics. Furthermore, we propose to encourage contributors to discuss new concepts and paradigms and to express their perspectives on the future development of the sirtuin research field. Altogether, we believe this issue provides a unique opportunity for comprehensive and diverse coverage of the topic and will be of broad interest for the journal's readership.
