Treatise on Zoology - Anatomy, Taxonomy, Biology. The Myriapoda, Volume 2 Alessandro Minelli,2015-09-29 Myriapods are the only major zoological group for which a modern encyclopedic treatment has never been produced In particular this was the single major gap in the largest zoological treatise of the XIX century Grass s Trait de Zoologie whose publication has recently been stopped The two volumes of The Myriapoda fill that gap with an updated treatment in the English language Volume II deals with the Diplopoda or millipedes As in the previous volume the treatment is articulated in chapters dealing with external and internal morphology physiology reproduction development distribution ecology phylogeny and taxonomy All currently recognized suprageneric taxa and a very large selection of the genera are considered All groups and features are extensively illustrated by line drawings and micrographs and living specimens of representative species of the main groups are presented in color photographs

Ecological Traits and Genetic Variation in Amazonian Populations of the Neotropical Millipede Poratia Obliterata (Kraus, 1960) (Diplopoda, Pyrgodesmidae) (Brazil) Natalie G. R. Bergholz,2007 The periodic flood pulse of the Amazon River has been the main controlling factor in the local ecosystems for at least two million years Numerous adaptations in some cases along with speciation have evolved in local terrestrial invertebrates The small millipede Poratia obliterata Kraus 1960 which probably

originates from the Andes is currently known from a remarkably broad range of Central Amazonian biotopes i.e. various seasonal inundation forests upland forest and plantations Like most native millipedes *P. oblitterata* appears to escape flooding by tree ascents Such developed survival strategies adaptive to annual inundation can either reflect ecological plasticity or implicate ecological speciation i.e. biotope specific races or ecotypes To assess the causal mode of adaptation ecological studies with genetic analyses are combined in this work Comparing the distribution biotope range population subdivision and genetic diversity of different millipedes the species *P. oblitterata* appears to feature a generalist strategy and widespread species which seems to cope well with various biotopes and thus successfully invaded seasonal inundation forests The book is addressed to specialists in evolution ecological genetics ecology and conservation of wetlands millipede research and conservation

Arthropod Diversity and Conservation in the Tropics and Sub-tropics Akshay Kumar Chakravarthy, Shakunthala Sridhara, 2016-11-23 Arthropods are invertebrates that constitute over 90% of the animal kingdom and their bio ecology is closely linked with global functioning and survival Arthropods play an important role in maintaining the health of ecosystems provide livelihoods and nutrition to human communities and are important indicators of environmental change Yet the population trends of several arthropods species show them to be in decline Arthropods constitute a dominant group with 1.2 million species influencing earth's biodiversity Among arthropods insects are predominant with ca. 1 million species and having evolved some 350 million years ago Arthropods are closely associated with living and non living entities alike making the ecosystem services they provide crucially important In order to be effective plans for the conservation of arthropods and ecosystems should include a mixture of strategies like protecting key habitats and genomic studies to formulate relevant policies for in situ and ex situ conservation This two volume book focuses on capturing the essentials of arthropod inventories biology and conservation Further it seeks to identify the mechanisms by which arthropod populations can be sustained in terrestrial and aquatic ecosystems and by means of which certain problematic species be managed without producing harmful environmental side effects This edited compilation includes chapters contributed by over 80 biologists on a wide range of topics embracing the diversity distribution utility and conservation of arthropods and select groups of insect taxa More importantly it describes in detail the mechanisms of sustaining arthropod ecosystems services and populations It addresses the contribution of modern biological tools such as molecular and genetic techniques regulating gene expression as well as conventional indigenous practices in arthropod conservation The contributors reiterate the importance of documenting and understanding the biology of arthropods from a holistic perspective before addressing conservation issues at large This book offers a valuable resource for all zoologists entomologists ecologists conservation biologists policy makers teachers and students interested in the conservation of biological resources

Advances in Terrestrial Isopod Biology Jasna ?trus, Stefano Taiti, Spyros Sfenthourakis, 2012-03-20 Terrestrial isopods woodlice are the only group of crustaceans fully adapted to life on land and with about 3 700 species

known at present represent the largest suborder of Isopoda. They occur in almost any kind of terrestrial habitat from littoral to high mountains from forests to deserts with some species adapted to live in subterranean environments and others secondarily having returned to water. Woodlice are particularly important from a biogeographical and an ecological point of view since they have limited dispersal ability, are often endemic to small geographic areas and are extremely diverse ecologically. They also represent an excellent model group of animals to study the physiological adaptations related to the transition from an aquatic to a terrestrial way of life. This special issue of ZooKeys includes a collection of 20 papers presented during the 8th International Symposium on Terrestrial Isopod Biology which was held at Bled, Slovenia from 19th to 23rd June 2011. Contributions address a wide range of topics related to terrestrial isopods such as systematics, biogeography, morphology, physiology, molecular biology, microbiology and ecology. Two contributions are related to the state of the art and future perspectives on biomineralizations in crustaceans and ecotoxicology in soil fauna. This special issue will be of great value for anyone interested in the biology of crustaceans in general and of terrestrial isopods in particular, stimulating future research on this unique group of animals.
