Koga,2007-11-12 As the title suggests we introduce a novel differential approach to solution thermodynamics and use it for the study of aqueous solutions We evaluate the quantities of higher order derivative than the normal thermodynamic functions We allow these higher derivative data speak for themselves without resorting to any model system We thus elucidate the molecular processes in solution referred to in this book mixing scheme to the depth equal to if not deeper than that gained by spectroscopic and other methods We show that there are three composition regions in aqueous solutions of non electrolytes each of which has a qualitatively distinct mixing scheme The boundary between the adjacent regions is associated with an anomaly in the third derivatives of G The loci of the anomalies in the temperature composition field form the line sometimes referred as Koga line We then take advantage of the anomaly of a third derivative quantity of 1 propanol in the ternary aqueous solution 1 propanol sample species H<sub>2</sub>O We use its induced change as a probe of the effect of a sample species on H<sub>2</sub>O In this way we clarified what a hydrophobe or a hydrophile and in turn an amphiphile does to H<sub>2</sub>O We also apply the same methodology to ions that have been ranked by the Hofmeister series We show that the kosmotropes salting out or stabilizing agents are either hydrophobes or hydration centres and that chaotropes salting in or destabilizing agents are hydrophiles A new differential approach to solution thermodynamics A particularly clear elucidation of the mixing schemes in aqueous solutions A clear understandings on the effects of hydrophobes hydrophiles and amphiphiles to H<sub>2</sub>O A clear understandings on the effects of ions on H<sub>2</sub>O in relation to the Hofmeister effect A new differential approach to studies in multi component aqueous solutions
