ones were used in yoke staves. The very design of the English plow lends its origin to the fact that more staves could be split from a tree if they were made narrow. So the bow had to get more of its power from its thickness, hence the idea of a semi-rectangular cross-section of the limbs. However, thickening a bow's limbs without widening them greatly increases the stress of torsion and compression. Yet is peculiar because its tapered ends function better than most whitewoods and its heartwood can hold up under a great deal of compression. With a quarter inch or so of tapered lift on its back, a yew longbow can withstand the stress of its design.

With the popular re-emergence of archery in the United States after the turn of the century, most of the noted author-authors of the day, such as the Thompson Brothers and Saxton Pope, turned to England for guidance. They made their bows in this style and Oregon yew was used

have fallen and this makes it easy to spot in early winter. However, Orange orange has an unusual characteristic in that it is seedless, so this trait will only identify the female trees. Learning to recognize a tree's other characteristics such as flowers, leaves, bark and buds is important.

Oregon trees can be found growing in open country, or near the banks of small streams, as well as in the dense hedge rows. The river bottom trees are the ones I prefer because they are straighter, the growth rings are larger and easier to follow with the tree knife, and they have fewer knots because the small, dead branches on the trunk may have already been pruned away by flooding. Trees that grow on both banks of river streams often have twisted grain in their trunks. This is caused by constant, uneven wind pressure against the tree's branches which forces it to curve in a spiral curve.¹²
