

John Bowlby's 4 Phases Of Attachment Development

John Bowlby described attachment as a, "lasting psychological connectedness between human beings" —believing early child-caregiver bonds had a powerful impact and continued throughout life. This handout looks at 4 phases of the development of attachment.

Pre-Attachment

(approximately birth to 6 weeks)

Infants attract caregivers with eye contact and signals like grasping, crying, smiling, and gazing.

Positive responses from the infant keep the caregiver close. This closeness comforts the infant.

Infants recognize the caregiver's scent, voice, and face.

Infants are not yet attached to the caregiver, don't mind being alone with unfamiliar adults, and don't fear strangers.

"Attachment In Making"

(approximately 6 weeks to 8 months)

Infants babble and smile more—and calm more quickly when picked up—with familiar caregivers than with strangers.

Infants learn their actions affect the behavior of those around them.

Infants begin to develop a sense of trust—expecting a predictable response from the caregiver.

Infants still do not mind being separated from their caregiver.

"Clear Cut" Attachment

(approximately 8 months to 18 months)

Attachment is evident. Babies become upset and experience separation anxiety when separated from a relied upon caregiver.

The occurrence of separation anxiety depends on the infant's temperament, adult behavior, and the specific situation.

The baby may show distress when the primary caregiver leaves, but the anxiety can be short lived if the replacement caregiver is empathetic and supportive.

Reciprocal Relationships

(approximately 18 months and on)

Separation anxiety decreases as language and cognitive skills grow.

Toddlers can understand some of the circumstances influencing the caregiver's comings and goings and can predict their return.

As they get older, toddlers grow less dependent on caregivers and more confident that they will be accessible and responsive in times of need.

The Role of Play in Child Assessment and Intervention Silvia Salcuni,Claudia Mazzeschi,Claudia Capella,2017-09-06 Play is a ubiquitous and universal aspect of early childhood Although it may take different forms throughout development and across cultures decades of research have found play to be related to important positive outcomes Play provides children with valuable cognitive emotional and interpersonal learning opportunities It can act as a mode of communication for young children and allows them to practice ways of managing complex interpersonal interactions Specific aspects of play such as children s creativity in pretend play have been associated with resilience and coping The significance of play in childhood has led to its frequent use in the assessment of child development and in the implementation of child and parent child psychological and educational interventions Historically however the validity and efficacy of these interventions have not been rigorously evaluated Further few assessment and intervention models have included parents teachers and other key caregivers but have focused only on the child This Research Topic will bring together the most current literature on the use of play in child assessment and intervention

Attachment in Social Networks L.W.C.

Tavecchio, M.H. van IJzendoorn, 1987-02-01 The main objective of the research presented in this book is to broaden the scope of attachment theory by stressing the importance of a social network approach to the study of attachment. This approach forms the integrating theme of this volume as is testified by various studies of attachment as it develops in an extended rearing context over and beyond the limits of the traditional mother-child dyad. In this connection attention is paid to the importance of sibling relationships, attachment relationships with professional caregivers, the role of the father in caring and rearing young children and the short-term and long-term effects on attachment quality of maternal employment in infancy. Also the cross-cultural validity of Ainsworth's Strange Situation is discussed with reference to the USA, Sweden, Israel, Japan, The Netherlands, etc. In adopting a social network approach, the attachment theory proves to be a particularly useful instrument for reflecting on the consequence of social change: maternal employment, symmetrical families, socialisation of childrearing for child development.

Drugs, Alcohol, Pregnancy and Parenting I.J. Chasnoff, 2012-12-06 The Interfaces of Perinatal Addiction. Ira J Chasnoff. In the last few years problems associated with drug use in pregnancy have become endemic. As cocaine has become the drug of choice for millions of Americans, including pregnant women, as AIDS has become more commonly recognized in women and infants and as legal cases have begun to raise the question of fetal abuse, no professional group has come forward to serve as advocate for this special population of substance abusers. Meanwhile, however, physicians, nurses, social service agencies and public health officials have all been faced with increasing numbers of infants showing the detrimental effects of their mothers' drug use. Although problems of substance abuse in pregnancy have received increasing attention in the medical literature since the early 1970s, there has recently been a very rapid increase in the number of articles published related to this field. The reasons for this new interest are easily understood when current statistics from the National Institute on Drug Abuse are reviewed. 1. Although patterns of abuse of alcohol, marijuana, heroin and other substances by women of childbearing age have changed very little over the last ten years, the incidence of cocaine use in this special population has been rising rapidly, a reflection of cocaine's increasing popularity among the general population of the United States.
