Arsenic in Drinking Water and Food Sudhakar Srivastava,2019-08-08 Arsenic contamination poses a major environmental problem especially in Southeast Asian countries like Bangladesh and India Threatening the health of millions of people due to arsenic s toxicity and carcinogenicity the major routes of arsenic exposure for humans are either through drinking water or crops Rice is the crop most affected by arsenic owing to its cultivation in major arsenic contaminated areas biogeochemical factors in the soil during rice growth and specific features of rice that enable it take up more arsenic than other crop plants This book addresses the problem of arsenic by pursuing a holistic approach It presents the status quo in different parts of the world North and South America Europe Asia etc and provides essential information on food related arsenic exposure risks for humans and possible preventive and curative measures for tackling arsenic poisoning It covers the arsenic contamination status of rice rice based products other vegetables fishes mushrooms and other foods with a special focus on rice arsenic interactions The mechanisms of arsenic uptake translocation and distribution in plants and grains are also explained In closing the book reviews a variety of prospective agronomic and biotechnological solutions to the problem of arsenic accumulation in rice grains The book is intended for a broad audience including researchers scientists and readers with diverse backgrounds including agriculture environmental science food science environmental management and human health It can also be used as an important reference guide for undergraduate and graduate students university faculties and environmentalists

Geology and Health H. Catherine W. Skinner,Antony R. Berger,2003-03-20 Geology and Health is an integration of papers from geo bio chemical scientists on health issues of concern to humankind worldwide demonstrating how the health and well being of populations now and in the future can benefit through coordinated scientific efforts International examples on dusts coal arsenic fluorine lead mercury and water borne chemicals that lead to health effects are

documented and explored They were selected to illustrate how hazards and potential hazards may be from natural materials and processes and how anthropomorphic changes may have contributed to disease and debilitation instead of solutions

Introductory essays by the editors highlight some of the progress toward scientific integration that could be applied to other geographic sites and research efforts A global purview and integration of earth and health sciences expertise could benefit the future of populations from many countries Effective solutions to combat present and future hazards will arise when the full scope of human interactions with the total environment is appreciated by the wide range of people in positions to make important and probably expensive decisions A case to illustrate the point of necessary crossover between Geology and Health was the drilling of shallow tube wells in Bangladesh to provide non contaminated ground water This good solution unfortunately mobilized arsenic from rocks into the aquifer and created an unforeseen or silent hazard arsenic Geologists produce maps of earth materials and are concerned with natural processes in the environment with long time frame horizons The health effects encountered through changing the water source might have been avoided if the hydrological characteristics of the Bangladesh delta had been known and any chemical hazards had been investigated and documented A recurrence of this type of oversight should be avoidable when responsible parties often government officials appreciate the necessity of such integrated efforts The book extols the virtues of cooperation between the earth life and health sciences as the most practical approach to better public health worldwide

Endocrine Disrupters and Carcinogenic Risk Assessment Lech Chyczewski, Jacek Niklinski, Eric Pluygers, 2002 This work is devoted to the study of the endocrine related effects on human health with special reference to carcinogenesis and to the assessment of carcinogenic risk After providing basic information at the general cellular and molecular levels the contents focus on the paradigm of biologically based risk assessment as developed from physiologically based toxicokinetic models The analysis of this material is proposed as the novel parameters for developing biologically based models of carcinogenesis considered to be more relevant to risk assessment than traditional approaches
