Applications of Queueing Theory C. Newell, 2013-03-09 The literature on queueing theory is already very large It contains more than a dozen books and about a thousand papers devoted exclusively to the subject plus many other books on probability theory or operations research in which queueing theory is discussed Despite this tremendous activity queueing theory as a tool for analysis of practical problems remains in a primitive state perhaps mostly because the theory has been motivated only superficially by its potential applications People have devoted great efforts to solving the wrong problems Queueing theory originated as a very practical subject Much of the early work was motivated by problems concerning telephone traffic Erlang in particular made many important contributions to the subject in the early part of this century Telephone traffic remained one of the principle applications until about 1950 After World War II activity in the fields of operations research and probability theory grew rapidly Queueing theory became very popular particularly in the late 1950s but its popularity did not center so much around its applications as around its mathematical aspects With the refinement of some clever mathematical tricks it became clear that exact solutions could be found for a large number of mathematical problems associated with models of queueing phenomena The literature grew from solutions looking for a problem rather than from problems looking for a solution

Deadline Scheduling for Real-Time Systems John A. Stankovic, Marco Spuri, Krithi Ramamritham, Giorgio C Buttazzo, 2012-12-06 Many real time systems rely on static scheduling algorithms This includes cyclic scheduling rate monotonic scheduling and fixed schedules created by off line scheduling techniques such as dynamic programming heuristic search and simulated annealing However for many real time systems static scheduling algorithms are quite restrictive and inflexible For example highly automated agile manufacturing command control and communications and distributed real time multimedia applications all operate over long lifetimes and in highly non deterministic environments Dynamic real time scheduling algorithms are more appropriate for these systems and are used in such systems Many of these algorithms are based on earliest deadline first EDF policies There exists a wealth of literature on EDF based scheduling with many extensions to deal with sophisticated issues such as precedence constraints resource requirements system overload multi processors and distributed systems *Deadline Scheduling for Real Time Systems EDF and Related Algorithms* aims at collecting a significant body of knowledge on EDF scheduling for real time systems but it does not try to be all inclusive the literature is too extensive The book primarily presents the algorithms and associated analysis but guidelines rules and implementation considerations are also discussed especially for the more complicated situations where mathematical analysis is difficult In general it is very difficult to codify and taxonomize scheduling knowledge because there are many performance metrics task characteristics and system configurations Also adding to the complexity is the fact that a variety of algorithms have been designed for different combinations of these considerations In spite of the recent advances there are still gaps in the solution space and there is a need to integrate the available solutions For example a list of issues to consider includes preemptive versus non preemptive tasks uni processors versus multi processors using EDF at dispatch time versus EDF based planning precedence constraints among tasks resource constraints periodic versus aperiodic versus sporadic tasks scheduling during overload fault tolerance requirements and providing guarantees and levels of guarantees meeting quality of service requirements *Deadline Scheduling for Real Time Systems EDF and Related Algorithms* should be of interest to researchers real time system designers and instructors and students either as a focussed course on deadline based scheduling for real time systems or more likely as part of a more general course on real time computing The book serves as

an invaluable reference in this fast moving field **Approximation, Randomization and Combinatorial Optimization: Algorithms and Techniques** Michel Goemans, Klaus Jansen, Jose D.P. Congress. House. Committee on Appropriations, 1924 *Optimal Load Balancing in Distributed Computer Systems* Hisao Kameda, Jie Li, Chonggun Kim, Yongbing Zhang, 2012-12-06 An important consideration in improving the performance of a distributed computer system is the balancing of the load between the host computers Load balancing may be either static or dynamic static balancing strategies are generally based on information about the system's average behavior rather than its actual current state while dynamic strategies react to the current state when making transfer decisions Although it is often conjectured that dynamic load balancing outperforms static careful investigation shows that this view is not always valid Recent research on the problem of optimal static load balancing is clearly and intuitively presented with coverage of distributed computer system models problem formulation in load balancing and effective algorithms for implementing optimization Providing a thorough understanding of both static and dynamic strategies this book will be of interest to all researchers and practitioners working to optimize performance in distributed computer systems A Politic Theatre: The Drama of David Hare Scott Fraser, 2022-06-08 This analysis of twenty published texts by David Hare employs definitions from contemporary semiotic literary theory as a means of describing typologies of political drama By tracing the incorporation of stylistic devices from agitational propaganda caricature self referentiality the frisson between oral and visual signification throughout the typologies the study illustrates how each text subverts audience expectation based on established dramatic genres The collection of texts is seen as inherently self referential and politically subversive At the centre of each typology is a protagonist who functions as a martyr to or parodic emblem of contemporary society Consistently the hermeticism of public institutions which represent the political status quo makes them immune from any form of individual protest from the Left or Right In the satirical anatomy the emblem of political dissent is coopted by involvement within the institution or the stage is dominated by a conservative who controls the action In the demythology private individuals are seen as incapable of altering the public frame of history but here private suffering subverts the collective mythology of the historical construct In the martyrology the emblem of dissent is associated with a moral virtue which is inimical to contemporary society the audience's

expectation of the triumph of the individual being subverted when he she is expelled from the onstage world on the grounds of political ideology It is only in the final typology the conversion that a conservative emblem is seen as directly influenced by such martyrdom and the audience is provided with an actual example of political change Thus the study describes how each typology builds on the construction of the previous and all generate from agitational propaganda
