Synthesis of Subsonic Airplane Design E. Torenbeek,2013-06-29 Since the education of aeronautical engineers at Delft University of Technology started in 1940 under the inspiring leadership of Professor H J van der Maas much emphasis has been placed on the design of aircraft as part of the student's curriculum Not only is aircraft design an optional subject for thesis work but every aeronautical student has to carry out a preliminary airplane design in the course of his study The main purpose of this preliminary design work is to enable the student to synthesize the knowledge obtained separately in courses on aerodynamics aircraft performances stability and control aircraft structures etc The student's exercises in preliminary design have been directed through the years by a number of staff members of the Department of Aerospace Engineering in Delft The author of this book Mr E Torenbeek has made a large contribution to this part of the study programme for many years Not only has he acquired vast experience in teaching airplane design at university level but he has also been deeply involved in design oriented research e.g. developing rational design methods and systematizing design information I am very pleased that this wealth of experience methods and data is now presented in this book Instruments and Spacecraft,

Sperry,1973 **Hypersonics** BERTIN,GLOWINSKI,PERIAUX,2012-11-28 The task of defining the aerothermodynamic environment for a vehicle flying through the air at hypersonic speeds offers diverse challenges to the designer He must integrate a wide variety of scientific and technical disciplines blending mathematical modeling computational methods and experimental measurements Many of the manned reentry vehicles are relatively blunt or fly at very high angles of attack so that the drag is relatively large and enter the atmosphere at a relatively low entry angle As a result the hypersonic deceleration occurs at very high altitudes Because the conversion of kinetic energy to internal energy modes occurs in a low density environment the flow field chemistry is an important consideration Experiments on the U S Space Shuttle

demonstrated the importance of nonequilibrium flow and surface catalycity on the heating to the vehicle To determine the aerothermodynamic environment of other vehicles operating hypersonically at very high altitudes e g the Aero Assisted Space Transfer Vehicle the designer may have to consider viscous inviscid interactions and the modeling of noncontinuum flows Configurations that have a relatively high ballistic coefficient such as slender reentry vehicles and reenter the atmosphere at relatively high angles of attack experience severe heating rates and high dynamic pressures but only for a short period of time For these vehicles continuum flow models incorporating equilibrium chemistry are reasonable 1978
