Artefacts Of Complexity:

Artefacts of Complexity J. N. Postgate, 2002 *Foundations for Functional Modeling of Technical Artefacts* Morten Lind, 2023-12-07 This monograph provides a new framework for modelling goals and functions of control systems It demonstrates how to use means end concepts and various aspects of action to describe the relations between the structure dispositions functions and goals of technical systems and with human action The author developed this approach as part of his research on Multilevel Flow Modelling MFM He based the framework on concepts of action and means end analysis drawing on existing theories from several areas of study including philosophical logic semiotics and phenomenological approaches to social science Here he applies it to three modeling situations related to the interaction of technical artefacts and humans One involves the relation between designer and artefact another the relation between technical artefact and its user and the third the relation between a natural object and its user All three are relevant for modelling complex automated processes interacting with human operators The book also discusses challenges when applying the foundations for modelling of technical artefacts Overall it provides a cross disciplinary integration of several fields of knowledge These disciplines include intelligent process control human machine interaction and process and automation design As a result researchers and graduate students in computer science engineering and philosophy of technology will find it a valuable resource

Joint Cognitive Systems Erik Hollnagel, David D. Woods, 2005-02-28 Nothing has been more prolific over the past century than human machine interaction Automobiles telephones computers manufacturing machines robots office equipment machines large and small all affect the very essence of our daily lives However this interaction has not always been efficient or easy and has at times turned fairly hazardous *Bio A.I. - From Embodied Cognition to Enactive Robotics*

Adam Safron, Inês Hipólito, Andy Clark, 2023-12-08 Even before the deep learning revolution the landscape of artificial intelligence AI was already changing drastically in the 90s Embodied intelligence it was proposed must play a crucial role in the design of intelligent machines This new wave was inspired by what is today known as Embodied and Enactive Cognitive Science or E Cognition which considers that cognitive activity does not reduce to the intellectual capacities of agents being able to represent their environments E cognition set AI and robotics in a new direction in which intelligent machines are required to interact with the environment and where this interaction does not reduce to explicit representations or prespecified algorithms These ideas revolutionized the way we think about intelligent machines and cognition but these theoretical advances are only partially reflected in modern approaches to AI and machine learning ML Despite deeply impressive achievements AI ML still struggles to recapitulate the kinds of intelligence we find in natural systems whether we are considering individual insects e g simultaneous localization and mapping or swarm behaviour e g foraging sensing and ensemble inferences and especially the kinds of flexibility and high level reasoning characteristic of human cognition **The Archaeology of Human Origins** Glynn Llywelyn Isaac, 1989 A collection of the most influential papers of the late Glynn

Isaac **Engineering and Philosophy** Zachary Pirtle, David Tomblin, Guru Madhavan, 2021-05-14 Engineers love to build things and have an innate sense of wanting to help society. However, these desires are often not connected or developed through reflections on the complexities of philosophy, biology, economics, politics, environment, and culture. To guide future efforts and to best bring about human flourishing and a just world, *Engineering and Philosophy: Reimagining Technology and Progress* brings together practitioners and scholars to inspire deeper conversations on the nature and varieties of engineering. The perspectives in this book are an act of reimagination: how does engineering serve society, and in a vital sense, how should it? *Advanced Information Systems Engineering* Zohra Bellahsène, Michel Léonard, 2008-06-08 CAiSE 2008 was the 20th in the series of International Conferences on Advanced Information System Engineering. This edition continued the success of previous conferences, a success largely due to the fact that since its first edition, this series has evolved in parallel with the evolution of the importance of information systems in economic development. CAiSE has been able to follow and often to anticipate important changes that have occurred since 1978 when the first CAiSE conference was organized by Arne Sjølvberg and Janis Bubenko. In all these years, modern businesses and IT systems have been facing an ever more complex environment characterized by openness, variety, and change. Furthermore, enterprises are experiencing ever more variety in their business in many dimensions. In the same way, the explosion of information technologies is overwhelming, with a multitude of languages, platforms, devices, standards, and products. Thus, enterprises need to manage an environment to monitor the interplay of changes in the business processes in information technologies and at the ontological level in order to achieve a sustainable development of their information systems. Enterprises must enter the era of sustainable information systems to face the important developmental challenges. During all these years, CAiSE researchers have been challenged by all these changes, and the CAiSE conferences provide a forum for presenting and debating important scientific results. In fact, CAiSE is positioned at the core of these tumultuous processes, hosting new emerging ideas, fostering innovative processes of design and evaluation, developing new information technologies adapted to information systems, creating new kinds of models, but always being subject to rigorous scientific selection. **Co-Evolution of Metamodels and Model Transformations** Steffen Kruse, 2015-08-03 Complexity is an essential property of software systems that increases in a non-linear fashion with the size of the software system. In software engineering, Model Driven Engineering (MDE) aims to alleviate this complexity by utilising models and modelling activities to raise the level of abstraction and to automate the production of artefacts. One specialised technique with this purpose is the model transformation, which allows the automated creation and modification of output models based on input models. As models and model transformations are used in a productive capacity, they underlie the same evolutionary pressure that conventionally build software systems do. Here, the tight coupling between model transformations and metamodels becomes problematic, as changing the one often results in the need to check and adapt the other accordingly. This thesis presents an operator-based stepwise approach to support software architects in the co-evolution of metamodels.

and model transformations The approach allows the description of changes done to a metamodel and the automatic or semi automatic resolution of the impact on related model transformations Overall the effort needed for co evolution is reduced
