Arterial Lesions And Arteriosclerosis:

Arterial Lesions and Arteriosclerosis H. Jellinek, 2012-12-06 This monograph summarizes the results of a fifteen year vascular pathology research project sponsored by the Hungarian Academy of Sciences The workers who have participated in this project are indebted to the Academy for financing extensive investigations and visits to institutes abroad the aims of which were to solve certain problems by international cooperation The results presented by the collective effort of research teams each studying here have been achieved a particular problem but working together to the same end Mutual discussion of findings and a regular exchange of information between the research groups have contributed to the progress of the investigations Regular publication of details and mutual criticism ensured that the findings were uniformly interpreted It is hoped that the fundamental aim of our long term project i e the selection of the right approach to the complex problem of vascular pathology has been achieved The new approach results from the recognition that since arteriosclerosis finally leads to various kinds of vascular injury attention should be focussed on the events preceding the development of the lesions rather than on the lesions themselves This claim has been confirmed by various model experiments in which vascular injury inflicted under different conditions uniformly led to morphologically verified arteriosclerotic change The recent increase in the incidence of civilization diseases of the vascular system has resulted in a world wide expansion of arteriosclerosis research

Arterial Mesenchyme and Arteriosclerosis William Wagner, 2013-03-09 Presently and in the past the predominant investigative emphasis among research workers in arteriosclerosis has been on plasma and arterial lipids Recent data from a number of laboratories suggest that arterial mesenchyme is of considerable importance in the pathogenesis and fate of arteriosclerotic lesions The significance of some of these observations made it clear that there was need for intensified research on the connective tissue components of the arteriosclerotic lesion and that arteriosclerosis research workers could benefit from a more comprehensive view of the subject Because of their experience in the field of arteriosclerosis and their interest in stimulating new directions for research on the lesion the Committee on Coronary Artery Lesions and Myocardial Infarctions of the Council on Arteriosclerosis American Heart Association planned an International Workshop on Arterial Mesenchyme and Arteriosclerosis The Workshop brought together scientists expert in connective tissue research and research on arteriosclerosis who presented the current status of knowledge in their areas of expertise The Workshop was held April 23 1973 at the Royal Orleans Hotel New Orleans Louisiana and was attended by more than 170 people The twenty papers and discussions presented in this volume summarize the proceedings of the Workshop and represent a comprehensive review of the role of arterial mesenchyme in arteriosclerosis

Atherosclerosis and Arteriosclerosis Rodney A. White, 2019-11-14 Selected as an outstanding book in vascular surgery by members of the Society for Vascular Surgery This unique new text describes the current understanding of the etiology and pathogenesis of human atherosclerosis It also details the methods for quantitating and characterizing both experimental and clinical lesions and describes the methods for

preparing available animal models Providing an in depth review of each of these topics the text organizes the information in one volume for the convenience of the reader The text is divided into two sections First is a description of the cell biology biochemistry and pharmacology of normal vessels and of atherosclerotic human lesions with details of the methods to accurately characterize and quantitate the disease Secondly it presents a description of the methods for preparing the available experimental animal models including a discussion of the distribution and pathological characteristics of the lesions It also includes comparisons of human atherosclerosis and experimental animal models Intended to provide a basis for expediting future research in this priority health care area this text compiles the available information for those who treat patients with atherosclerosis or who are involved in atherosclerosis research It is of particular interest to students physicians and academic and commercial researchers

Pathobiology of the Human Atherosclerotic Plaque Seymour

Glagov, William P., III Newman, Sheldon A. Schaffer, 2012-12-06 Seymour Glagov The last meeting devoted exclusively to an examination of the atherosclerotic plaque took place in Chicago 25 years ago under the joint auspices of the Council on Arteriosclerosis of the American Heart Association and the Chicago Heart Association The proceedings were published subsequently in a volume entitled Evolution of the Atherosclerotic Plaque edited by Richard J Jones 1 Both experimental and human lesions were considered and several provocative new approaches to the disorder were discussed The electron microscope was being applied systematically to the study of blood vessels at that time so that details of the infrastructure and cellular composition of the artery wall and of atherosclerotic lesions were presented in some detail There was as one result of these explorations considerable discussion of morphologic evidence suggesting that the principal cell involved in the atherogenic process was neither the fibroblast nor the macrophage as had been supposed but the smooth muscle cell In particular the findings indicated that this cell could incorporate lipid and become a foam cell

Arteriosclerosis, Cardiovascular Disease William Ophüls, 1921

Arteriosclerosis H. Just, W. Hort, A.M. Zeiher, 2012-12-06 A vast literature has been concerned with arteriosclerosis and yet many aspects of pathogenesis and of the mechanism of development of the arteriosclerotic vascular lesion remain only poorly understood In recent years our knowledge of the earliest stages of arteriosclerosis have greatly improved By now we have learned to relate morphologic changes to disturbances in function It has been of particular importance that components of the arterial wall could be analyzed in regard to dysfunction for example in the endothelium or the vascular smooth muscle The interaction of the different morphological components of the vascular wall could thus be much better understood Likewise the interaction between the arterial wall and the flowing blood could be much better described including the intimate relationship between platelets and the endothelium the coagulation system and the endothelium the granulocytes and the endothelial cell layer as well as processes of migration of blood cells into the subendothelial space The recognition of functional and morphological disturbance has attained clinical significance not only because the arteriosclerotic diseases have quantitatively reached the dimensions of an epidemic that is of a

magnitude never been witnessed It is also because of the development of new drugs that interfere with the atherogenic process and thereby prevent the development of the disease or halt its progression It is also becoming increasingly possible to inhibit the occurrence of complications in existing arteriosclerotic lesions in manifest disease i e **The Artery and the Process of Arteriosclerosis** Stewart Wolf,2013-03-09 The present volume contains the first half of the edited transcript of a six day Conference Fundamental Data on Reactions of Vascular Tissue in Man held April 19 25 1970 in Lindau West Germany The remainder of the proceedings dealing with the epidemiologic clinical and preventive aspects of arteriosclerosis will be published in a second volume The Conference was held under the auspices of the International Society of Cardiology the International Cardiology Foundation and the European Atherosclerosis Group The aim of the Conference was to achieve a synthesis of present knowledge concerning arteriosclerosis Therefore workers were brought together from several countries and from various disciplines that do not ordinarily intercommunicate for free exchange of data and ideas Six broad subject areas were introduced by single papers three of them are included in this volume In the discussion which followed each formal presentation the participants attempted to reconcile disparate data and interpretations and to reach a clear identification of important areas of ignorance and of crucial questions for future research The format of the proceedings does not follow precisely that of the Conference itself The formal papers are included somewhat abbreviated and excerpts of the discussion have been gathered under a series of topics arranged in logical sequence Therefore the quoted statements do not necessarily appear in order or in the place in the program where they were made Principal issues syntheses and unanswered questions are interspersed among the topics as editorial comments Clinical Diagnosis of Atherosclerosis M. G. Bond,W. Jr. Insull,S. Glagov,A. B. Chandler,J. F. Cornhill,2012-12-06 This volume is the product of a February 1982 conference cosponsored by the American Heart Association the National Institutes of Health and the Bowman Gray School of Medicine which examined techniques for delineating quantitatively the natural history of atherosclerosis Against the background of current pathologic and clinical knowledge of atherosclerosis invasive and noninvasive evaluative methods now in use and under development are surveyed in depth Correlative clinicopathologic studies of atherosclerosis pose special questions with respect to both luminal and plaque characteristics that are addressed in this volume An old observation based on the examination of arterial casts suggested that the so called nodose lesion of atherosclerosis may be at first flattened into the wall of a weakened dilated artery rather than raised into the lumen This is now fully confirmed in vivo by ultrasonic and other imaging techniques The morbid anatomist is challenged anew to describe lesions as they are likely to occur in vivo To achieve closer correlation with natural conditions perfusion fixation of arteries under arterial pressure is becoming more widely used and has already demonstrated more valid quantitation of the composition and configuration of lesions While the noninvasive methods of B mode and Doppler ultrasound are suitable only for the clinical study of superficial arteries such as the carotid or femoral the new and relatively noninvasive procedure of intravenous digital subtraction angiography can be

effectively used for the examination of deep systems such as cerebral vessels Testicular Vascular Lesions Manuel Nistal, Pilar González-Peramato, 2024-08-22 This book is unique because it transmits what the authors had learned in more than 40 years dedicated to teaching and studying testicular pathology The work provides an integrating perspective on aspects of non tumour pathology of the testicle on testicular vascular pathology Apart from the role of varicocele or testicular loss due to torsion of the spermatic cord references to vascular pathology in Urology treatises are very scarce This book brings together knowledge on arterial venous and lymphatic pathology which have a negative impact on testicular function Thanks to the high volume of material accumulated over the years in the Pathology Department of the Hospital Universitario La Paz the authors ensure that the manuscript has an orderly structure that facilitates consultation or its use for teaching purposes The content is structured in three sections The first 10 chapters are dedicated to arterial pathology the following 5 to venous pathology and 4 to pathology of the lymphatic vessels This structured presentation of vascular pathology of the testis is useful for diagnosis and teaching in the fields of pathology urology andrology *Magnesium Deficiency in the Pathogenesis of Disease* Mildred S. Seelig, 2012-12-06 There is a large and rapidly growing body of literature on the importance of magnesium in biochemical and physiological processes There is also much evidence that magnesium deficiency alone and in combination with agents that interfere with its utilization is associated with functional and structural abnormalities of membranes cells organs and systems The manifestations of the changes caused by magnesium deficiency depend upon its extent and duration and on variable factors Among the conditions that increase the risk of magnesium deficiency are 1 metabolic factors that affect the absorption distribution and excretion of this mineral 2 disease and therapy 3 physiologic states that increase requirements for nutrients and 4 nutritional imbalances Excesses of nutrients that interfere with the absorption or increase the excretion of magnesium such as fat phosphate sugar and vitamin D can contribute to long lasting relative magnesium deficiency All have been implicated in several of the diseases considered in this book Whether their influence on the need for magnesium is a common denominator remains to be investigated further

Levy, Alain Tedgui, 2007-11-23 *Biology of the Arterial Wall* is intended as a general reference text concerned with the biology of the vascular cells and the blood vessel wall under physiological and pathological conditions One of the major functions of the arteries is to maintain a continuous blood flow to the organs whatever the pressure conditions thanks to the vasomotor tone of the smooth muscle cells Great advances have been made over the last decade in the understanding of the endothelial cells as integrators and transducers of signals originating from the blood stream The pluripotent control functions of the endothelial cells in the vessel wall are now well recognized A review of endothelial functions and dysfunctions is presented Cell biology and molecular genetic studies have now identified an array of molecules elaborated by endothelial cells and vascular smooth muscle cells and by the blood borne elements which interact with artery cells defending the artery against injury and modulating evolving abnormal processes Molecules which induce or inhibit endothelial and or smooth muscle cells are currently under great scrutiny Angiogenesis which plays a major role in tumor growth but may also be beneficial as a healing process in muscle ischemia is discussed Apoptosis or programmed cell death has only recently been recognized as an essential process in blood vessel modeling and remodeling An overview of apoptosis in the vascular system is presented It is increasingly evident that the adjustments of the blood vessel wall are made in the presence of deforming disease processes such as hypertension and atherosclerosis The second part of the book is concerned with the blood vessel wall in disease conditions Several chapters review the role of the vessel and vascular cells in inflammation and vascular remodeling during arterial hypertension and aging One chapter is devoted to atherogenesis atheroma and plaque instability followed by the pathophysiology of post angioplasty restenosis which is a crucial issue in modern interventional cardiology
