Basic Medical Histology The Biology Of Cells Tissues And Organs:

Basic Medical Histology Richard G. Kessel, 1998 This text serves to introduce students to histology It provides a thorough and current treatment of the structure organization and function of the basic tissue types of the body as well as the organ systems which are organized from the basic tissues The text presents a more modern cell biological emphasis on the subject while also bringing out the clinical correlations of histology in every chapter Text material is frequently summarized in the many charts tables and diagrams that are distributed throughout the book The organization is intended to facilitate the rapid transfer of information from the book to the student The book is written for medical and dental students as well as other professionals who are introduced to histology during their first year of professional schooling It is also intended to serve the needs of advanced undergraduates who often take such a course in preparation for professional schools The book contains limited amounts of biochemistry physiology endocrinology and neurobiology but a sufficient amount of material so that the student can correlate functional information to the microscopic organization of tissues and organs Hopefully this mix will permit maximum learning and understanding of structure function relationships Since the students who first encounters histology is typically introduced to a large body of information in a limited time period we have sought to maximize the rapid transfer of information by the extensive use of summary type tables charts and drawings In addition a central portion of the book contains a limited number of color illustrations which will permit the student to view and recognize stained sections of tissues and organs The color atlas should facilitate the student's view of laboratory work

Handbook of Cardiac Anatomy, Physiology, and Devices Paul A. Iaizzo, 2010-03-11 A revolution began in my professional career and education in 1997 In that year I visited the University of Minnesota to discuss collaborative opportunities in cardiac anatomy physiology and medical device testing The meeting was with a faculty member of the Department of Anesthesiology Professor Paul Iaizzo I didn't know what to expect but as always I remained open minded and optimistic Little did I know that my life would never be the same During the mid to late 1990s Paul Iaizzo and his team were performing anesthesia research on isolated guinea pig hearts We found the work appealing but it was unclear how this research might apply to our interest in tools to aid in the design of implantable devices for the cardiovascular system As discussions progressed we noted that we would be far more interested in reanimation of large mammalian hearts in particular human hearts Paul was confident this could be accomplished on large hearts but thought that it would be unlikely that we would ever have access to human hearts for this application We shook hands and the collaboration was born in 1997 In the same year Paul and the research team at the University of Minnesota including Bill Gallagher and Charles Soule reanimated several swine hearts Unlike the previous work on guinea pig hearts which were reanimated in Langendorff mode the intention of this research was to produce a fully functional working heart model for device testing and cardiac research

University of California, San Francisco, 1976 Medical Histology R. L. Bacon, N. R. Niles, 2012-12-06 It is difficult for a teacher to accept the fact that not all of the information in his or her field is a necessary part of the armamentarium of the student This holds for histologists and for that matter pathologists biochemists and ophthalmologists It may especially hold for those who were trained during exciting periods in the history of their discipline In the past two decades information in every basic medical science has increased greatly perhaps exponentially and the basic science curriculum has been compressed to the point where the medical student can reasonably be expected to acquire only a superficial knowledge of anyone of these sciences Hence the information provided must be carefully selected effectively presented in retainable doses and useful for understanding material to be presented later in the curriculum and for the solution of clinical problems In the

compact courses of today the presentation of only enough data to support basic working concepts of structure and function is appropriate Additional factual information constitutes trivia which in our opinion interferes with effective development retention and use of the concepts This philosophy has been the basis for the preparation of this book Consistent with this philosophy the text is brief and the content has been carefully examined for its appropriateness to the needs of the medical student
