

TYPES OF SERVO

There are two main classes of servomechanism – remote position control (RPC) servos and velocity control servos (velodynes):

- **RPC servos.** These are used to control the angular, or linear position of a load. A typical example of the use of a RPC servo is the control of the direction in which a radar scanner is pointing.
- **Velodynes.** These are used to control the speed of a load. In this case, the speed of the driving motor is made proportional to the input demand (usually a voltage). A typical example of the use of a velodyne is the control of a radar scanner, which is required to rotate with a constant angular velocity
