**Chemistry and Biochemistry of Oxygen Therapeutics** Andrea Mozzarelli,Stefano Bettati,2011-07-07 Human blood performs many important functions including defence against disease and transport of biomolecules but perhaps the most important is to carry oxygen the fundamental biochemical fuel and other blood gases around the cardiovascular system Traditional therapies for the impairment of this function or the rapid

replacement of lost blood have centred around blood transfusions. However, scientists are developing chemical oxygen therapeutics or blood substitutes which have the same oxygen carrying capability as blood and can be used as replacements for blood transfusion or to treat diseases where oxygen transport is impaired.

**Chemistry and Biochemistry of Oxygen Therapeutics: From Transfusion to Artificial Blood** links the underlying biochemical principles of the field with chemical and biotechnological innovations and pre-clinical development. The first part of the book deals with the chemistry, biochemistry, physiology and toxicity of oxygen, including chapters on hemoglobin reactivity and regulation, the major cellular and physiological control mechanisms of blood flow and oxygen delivery, hemoglobin and myoglobin, nitric oxide and oxygen, and the role of reactive oxygen and nitrogen species in ischemia reperfusion injury. The book then discusses medical needs for oxygen supply, including acute traumatic hemorrhage and anemia, diagnosis and treatment of haemorrhages in non-surgical patients, management of perioperative bleeding, oxygenation in the preterm neonate, ischemia, normobaric and hyperbaric oxygen therapy for ischemic stroke and other neurological conditions, and transfusion therapy in thalassemia and sickle cell disease. Finally, old and new strategies for oxygen supply are described. These include the political, administrative and logistic issues surrounding transfusion, conscientious objection in patient blood management, causes and consequences of red cell incompatibility, biochemistry of red blood cell storage, proteomic investigations on stored red blood cells, red blood cells from stem cells, the universal red blood cell allosteric effectors of hemoglobin, hemoglobin-based oxygen carriers, oxygen delivery by natural and artificial oxygen carriers, cross-linked and polymerized hemoglobins as potential blood substitutes, design of novel pegylated hemoglobins as oxygen-carrying plasma expanders, hb octamers by introduction of surface cysteines, hemoglobin vesicles as a cellular-type hemoglobin-based oxygen carrier, animal models and oxidative biomarkers to evaluate pre-clinical safety of extracellular hemoglobins, and academia-industry collaboration in blood substitute development.

**Chemistry and Biochemistry of Oxygen Therapeutics: From Transfusion to Artificial Blood** is an essential reference for clinicians, haematologists, medicinal chemists, biochemists, molecular biologists, biotechnologists, and blood substitute researchers.
