

ATTACK **ON** the ARMY ANTS

How one of the largest, most complex, and most aggressive organisms on the planet was captured.

Text by BRIAN L. FISHER Photography by DONG LIN

THE PLAN WAS SIMPLE: JET down to Trinidad, track down a nest of a million army ants, suck them up in a vacuum cleaner and, twelve hours later, install them in a 500-square-foot glass arena back in San Francisco.

For eight months we had been negotiating all the permits and design issues of this innovative project. No one had ever attempted to keep army ants alive for a whole year in captivity. The escape-proof cages were built and tested. Cricket farms were standing by, ready to begin shipping the 15,000 crickets a week necessary to feed the colony.

Then, on April 2, two weeks before departure, the airline called and said they had canceled our flights. They had reviewed our request and concluded it was too great a risk to fellow passengers to share a plane with a million voracious

insects. Their research had revealed that army ants can kill a horse and they would not accept the responsibility. Despite my assurance that there would be no horses on the plane, they were adamant.

Ants are one of the great success stories in the history of terrestrial life. There is nowhere you can live and not meet an ant. If you took all the humans alive today and then gathered up all the world's ants, they would be roughly equal in weight.

Ants are the only lifeform that competes with humans for dominance. Ants are rulers of their tiny, hidden world, a world near our feet that most of us ignore—unless you are a kid or have a house infested with the ubiquitous Argentine ants. But these overlooked creatures are essential for healthy habitats. They are the glue that holds many an ecosystem together.

The dominant, big bad wolf of the ant family are the army ants—the Huns and

Tartars of the insect world. The majority of army ants are subterranean like those belonging to the genus *Neivamyrmex*, found in Northern California. Our objective, however, was to capture the spectacular South American species *Ectophasia bartholffi*, which nests and forages above ground. Army ants never hunt alone, but instead dispatch a pack of cooperative, leaderless hunters to locate and overwhelm prey. They run down and attack their victims en masse, and use their cooperative skills to dismember creatures often much larger than themselves and carry their booty home.

This contrasts with other types of ants which first send out individual scouts to locate food sources and only later recruit additional help. Because these wolf packs sweep clean all prey within range, army ants must continually migrate to new foraging locales and never construct permanent nests. Instead, they form bivouacs, temporary, above-ground nests made out of their own bodies. They link legs together, creating a tightly woven mesh of bodies and legs that form chambers for the brood and queen. They also link legs when traveling to make bridges to cross streams and to fill in gaps in the trails.

Capturing a single army ant is very different than capturing an entire colony. Individually, they can only inflict an irritating sting, but as a group, they become a pack of remorseless hunters. It's this behavior that caught the attention of the airline agent and grounded our mission. Reports of army ants killing horses, or needing flamethrowers to control their rampage, as in the story of "Leiningen vs. the Ants," are exaggerations, but they are based on a modicum of truth.

THE ARMY ANT DISPLAY WAS TO BE the star exhibit of the California Academy of Sciences' new building, due to open in less than a month. Over the previous eight months we had met with inspectors from the California Department of Food and Agriculture (CDFA) and U.S. Department of Agriculture (USDA) who had guided us through their complicated requirements. The ants had to be 100 percent contained. If a single ant specimen were found outside the containment facility, we would be shut down and the ants
