

The orbit of the MOON

Lunar month

The Moon completes one orbit around the Earth (a sidereal month), in 27.3 days. Because the Earth is also orbiting the Sun, it takes two more days for the Moon to complete its cycle of phases (a synodic month).

Elliptical orbit

The Moon's orbit has an elliptical (oval) shape, although it looks almost like a circle.

Apsidal precession

The Moon's elliptical orbit orientation changes its orientation, or precesses, with a period of 8.85 years.

Drifting away

Every year the Moon's orbit is expanding, taking it farther away from Earth by an average of 3.8 centimeters.

Nodal precession

The plane of the lunar orbit is tilted 5 degrees relative to Earth's orbit around the Sun. It precesses in an 18.6-year cycle.

Around the Moon Jules Verne's sequel to *From the Earth to the Moon* is a science fiction novel continuing the trip to the moon which left the reader in suspense after the previous novel. Having been fired out of the giant Columbiad space gun, the Baltimore Gun Club's bullet-shaped projectile along with its three passengers Barbicane, Nicholl, and Michel Ardan begins the five-day trip to the moon.

All Around the Moon Jules Verne, 2019-03-05 A few years ago the world was suddenly astounded by hearing of an experiment of a most novel and daring nature altogether unprecedented in the annals of science. The BALTIMORE GUN CLUB, a society of artillerymen started in America during the great Civil War, had conceived the idea of nothing less than establishing direct communication with the Moon by means of a projectile. President Barbican, the originator of the enterprise, was strongly encouraged in its feasibility by the astronomers of Cambridge Observatory and took upon himself to provide all the means necessary to secure its success. Having realized by means of a public subscription the sum of nearly five and a half millions of dollars, he immediately set himself to work at the necessary gigantic labors. In accordance with the Cambridge men's note, the cannon intended to discharge the projectile was to be planted in some country not further than 28° north or south from the equator so that it might be aimed vertically at the Moon in the zenith. The bullet was to be animated with an initial velocity of 12 000 yards to the second. It was to be fired off on the night of December 1st at thirteen minutes and twenty seconds before eleven o'clock precisely. Four days afterwards it was to hit the Moon at the very moment that she reached her perigee, that is to say her nearest point to the Earth, about 228 000 miles distant.
