A book is accidentally left on the roof of a car as the driver drives away. As the car and the book move with constant velocity along the street, what must be true about the magnitude (size) of the forces acting on the book? Choose the book *proper*.

- ☐ Static friction acting on the book due to air resistance is larger than static friction between the roof of the car and the book.
- ☐ Static friction between the book and the car is larger than air friction in the other direction, and this allows the book to move forward.
- ☒ Static friction between the book and the roof of the car has the same magnitude as kinetic friction caused by air resistance.
- ☐ There is no force of gravity acting on the book because the book rests on the car and does not fall.

Correct. Since the book is not accelerating, the net force acting on the book must be zero. The forces are balanced.

A calculator is left on top of a book and the book is then pushed so that it slowly accelerates across a desk, taking the calculator with it. The person pushing the book does not touch the calculator. What type of force causes the calculator to accelerate?

- ☐ The calculator is accelerated by a *kinetic* friction force applied by the *person's hand*.
- ☐ The calculator is accelerated by a *static* friction force applied by the *person's hand*.
- ☐ The calculator is accelerated by a *kinetic* friction force caused by the *book*.
- ☒ The calculator is accelerated by a *static* friction force caused by the *book*.

Correct. This is because the calculator is touching the book (not the person's hand), and because the calculator is not moving relative with respect to the top of the book.
