

Methods for evaluation include mediastinoscopy, mediastinotomy, EBUS, EUS, and CT-guided biopsy. An EBUS-TBNA negative for malignancy in a clinically (PET and/or CT) positive mediastinum should undergo subsequent mediastinoscopy prior to surgical resection.

^a PET/CT performed skull base to knees or whole body. Positive PET/CT scan findings for distant disease need pathologic or other radiologic confirmation. If PET/CT scan is positive in the mediastinum, lymph node status needs pathologic confirmation.

^b Principles of Surgical Therapy (NSCL-8).

^c Principles of Radiation Therapy (NSCL-C).

^d If MRI is not possible, CT of head with contrast.

^e Perioperative Systemic Therapy (NSCL-E).

^f Concurrent Chemoradiation Regimens (NSCL-F).

^g R0 = no residual tumor, R1 = microscopic residual tumor, R2 = macroscopic residual tumor.

^h For patients whose tumors are negative for EGFR exon 19 deletion or exon 21 L858R mutations or ALK rearrangements who received previous adjuvant chemotherapy. The benefit for patients with PD-L1 <1% is unclear.

^p For patients with EGFR exon 19 deletion or exon 21 L858R mutations who received previous adjuvant chemotherapy or are ineligible to receive platinum-based chemotherapy.

^q For patients with PD-L1 ≥1% and negative for EGFR exon 19 deletion or exon 21 L858R mutations or ALK rearrangements who received previous adjuvant chemotherapy.

^{aa} Lesions with different cell types (eg, squamous cell carcinoma, adenocarcinoma) are usually different primary tumors. This analysis may be limited by small biopsy samples. However, lesions of the same cell type are not necessarily metastases. Single contralateral lung nodules with clinical, radiologic, or pathologic features suggestive of a synchronous primary lung cancer (eg, long disease-free survival, ground glass components, different histologic characteristics) that are amenable to local therapy should be considered as probable separate primary cancers and eligible for local therapy (NSCL-11). Multiple studies suggest that next-generation sequencing (NGS) testing with broad gene coverage may allow for unambiguous determination of clonal relatedness among separate lung nodules.

^{bb} For guidance regarding the evaluation, workup, and management of subsolid pulmonary nodules, please see the diagnostic evaluation of a nodule suspicious for lung cancer (DIAG-1).
