

## ANTIGENS

An antigen is a foreign substance that elicits the production of antibodies.

**Antigenicity** is therefore the term used to refer the ability of an antigen to react with the specific antibody that has already been formed.

A complete antigen must be able to stimulate the formation of specific antibodies AND react specifically with these antibodies (immunogenicity and reactivity, respectively).

A **hapten** is a molecule that is too small to elicit an immune response, but can react with a specific antigen.

An **epitope** is the site on an antigen recognized by an antibody. An epitope is also known as the antigenic determinant.

An **immunogen** is an antigen that induces an immune response when introduced into the body. Therefore, **immunogenicity** is defined as the ability of a subject to provoke an immune response.

Factors that determine the *immunogenicity* of an antigen include:

1. Foreignness – The molecule must be non-self.
2. Molecular size – The larger the molecule, the more the immunogenic it is.
3. Chemical and structural complexity – the more complex a molecule is, the more immunogenic it is. E.g. proteins are more likely to be immunogenic than a carbohydrate.
4. Presence of an antigenic determinant (epitope)

**Structure of Antigens** Marc H. V. Van Regenmortel, 1995-12-20 Volume 3 of Structure of Antigens presents analytical methods used to elucidate the structure of antigens As in the first two volumes this reference focuses on the structure and analysis of antibody binding sites It brings together the structural basis of major types of antigens including lysozyme cytochrome c muscle proteins cereal and milk proteins carbohydrate antigens and more Major groups of antigens associated with particular biological systems such as the cytoskeleton muscle proteins and viral antigens are discussed This reference analyzes the molecular basis of antibody specificity and the structure of T cell epitopes Antigen Processing and Presentation Protocols Joyce C. Solheim, 2007-10-26 Antigen processing and presentation as a field explores a broad range of protein interactions and functions both intracellular in the cytoplasm and in the endoplasmic reticulum and at the cell surface between T cells and MHC molecules To investigate such a diverse array it is necessary that biochemical cell biology and immunological techniques all be employed The purpose of Antigen Processing and Presentation Protocols is therefore to detail the most up to date techniques being used in this burgeoning field Such techniques include those used to question how MHC binding peptides are generated to test how peptides are delivered to MHC molecules to analyze MHC peptide binding patterns and to assay the T cell response to MHC peptide Antigen Processing and Presentation Protocols should aid both those new and those experienced in this area of research in extending the questions that can be asked and answered by the application of these current methods For editorial assistance I would like to thank Angela Beninga and Rachael Turnquist

*Biologically-responsive Hybrid Biomaterials: A Reference For Material Scientists And Bioengineers* Esmail Jabbari, Ali Khademhosseini, 2010-03-08 Conjugation of synthetic materials with cell responsive biologically active molecules in addition to providing structural support and release of biomolecules in the regenerating region can provide the signaling factors required to initiate the cascade of cell migration adhesion differentiation maturation growth factor modulation maintenance of matrix integrity and tissue morphogenesis Nanoparticles conjugated with ligands that preferentially interact with cell surface receptors in the tumor environment have the potential to drastically improve bioavailability selectivity and residence time of the chemotherapeutic agent in the tumor microenvironment while limiting their peripheral toxicity Multivalent presentation of tumor associated antigens on a targeted delivery system containing T and B cell epitopes can result in strong long lasting self adjuvant immunity against cancer and other diseases in vaccination These examples demonstrate that cell responsive conjugate biomaterials have profoundly impacted the medical field This book is divided into three sections In the first section synthesis and characterization conformation structure activity self assembly and host response of conjugate

hybrid biomaterials are covered The second section is dedicated to the applications of conjugate biomaterials in drug delivery and vaccination while the last section is devoted to tissue engineering applications including cell adhesion control of the stem cell niche cartilage regeneration neural and vascular tissue engineering and dynamic cell culture systems for functionalized biomaterials There is no doubt that biologically responsive conjugate biomaterials play a key role in the design of biologics and medical devices and this pioneering reference book provides a comprehensive review on synthesis characterization structure activity 3D assembly fabrication host response and the emerging applications of conjugate hybrid biomaterials
