Automotive Power Train Systems:

Vehicle Powertrain Systems David Crolla, Behrooz Mashadi, 2011-12-30 The powertrain is at the heart of vehicle design the engine whether it is a conventional hybrid or electric design provides the motive power which is then managed and controlled through the transmission and final drive components The overall powertrain system therefore defines the dynamic performance and character of the vehicle The design of the powertrain has conventionally been tackled by analyzing each of the subsystems individually and the individual components for example engine transmission and driveline have received considerable attention in textbooks over the past decades The key theme of this book is to take a systems approach to look at the integration of the components so that the whole powertrain system meets the demands of overall energy efficiency and good drivability Vehicle Powertrain Systems provides a thorough description and analysis of all the powertrain components and then treats them together so that the overall performance of the vehicle can be understood and calculated The text is well supported by practical problems and worked examples Extensive use is made of the MATLAB R software and many example programmes for vehicle calculations are provided in the text Key features Structured approach to explaining the fundamentals of powertrain engineering Integration of powertrain components into overall vehicle design Emphasis on practical vehicle design issues Extensive use of practical problems and worked examples Provision of MATLAB R programmes for the reader to use in vehicle performance calculations This comprehensive and integrated analysis of vehicle powertrain engineering provides an invaluable resource for undergraduate and postgraduate automotive engineering students and is a useful reference for practicing engineers in the vehicle industry

Systems Engineering for Automotive Powertrain Development Hannes Hick, Klaus Küpper, Helfried Sorger, 2020 For the last century the automotive industry has been dominated by internal combustion engines Their flexibility of application driving range performance and sporty characteristics has resulted in several generations of this technology and has formed generations of engineers But that is not the end of the story Stricter legislation and increased environmental awareness have resulted in the development of new powertrain technologies in addition and parallel to the highly optimized internal combustion engine Hybrid powertrains systems pure battery electric systems and fuel cell systems in conjunction with a diverse range of applications have increased the spectrum of powertrain technologies Furthermore automated driving together with intelligent and highly connected systems are changing the way to get from A to B Not only is the interaction of all these new technologies challenging but also several different disciplines have to collaborate intensively in order for new powertrain systems to be successfully developed These new technologies and the resulting challenges lead to an increase in system complexity Approaches such as systems engineering are necessary to manage this complexity To show how systems engineering manages the increasing complexity of modern powertrain systems by providing processes methods organizational aspects and tools this book has been structured into five parts Starting with Challenges for Powertrain

Development which describes automotive related challenges at different levels of the system hierarchy and from different point of views The book then continues with the core part Systems Engineering in which all the basics of systems engineering model based systems engineering and their related processes methods tools and organizational matters are described A special focus is placed on important standards and the human factor The third part Automotive Powertrain Systems Engineering Approach puts the fundamentals of systems engineering into practice by adding the automotive context This part focuses on system development and also considers the interactions to hardware and software development Several approaches and methods are presented based on systems engineering philosophy Part four Powertrain Development Case Studies adds the practical point of view by providing a range of case studies on powertrain system level and on powertrain element level and discusses the development of hybrid powertrain internal combustion engines e drives transmissions batteries and fuel cell systems Two case studies on a vehicle level are also presented The final part Outlook considers the development of systems engineering itself with particular focus on information communication technologies Even though this book covers systems engineering from an automotive perspective many of the challenges fundamental principles conclusions and outlooks can be applied to other domains too Therefore this book is not only relevant for automotive engineers and students but also for specialists in scientific and industrial positions in other domains and anyone who has to cope with the challenge of successfully developing complex systems with a large number of collaborating disciplines

Automotive Power Train Systems Jay Webster,
The Future of Automotive Powertrain Development Min Xu,Yijia Zhang,2025-03-02 The electrification momentum of automotive powertrains has slowed down globally in recent years At the same time hybrid powertrains once treated as

transitional technology so as to be ignored have achieved outstanding market performance and are increasingly gaining attention. A diversified powertrain technology landscape is gradually forming over the previous internal combustion dominant or the expected battery electric dominant scenarios. Due to misinformation and the communication barrier, some perceptions about China's automotive industry and powertrain technology within the international community remain partial, outdated and misleading. The Future of Automotive Powertrain Development Insights from the Chinese Market speaks to future trends for automotive powertrains and promotes the formation of a global consensus by sharing insights from powertrain experts at leading Chinese automakers and providing firsthand insights into the actual state of the Chinese automotive industry. 9781468609325 9781468609332 <https://doi.org/10.4271/EPR2025004> *Powertrain Systems for Net-Zero Transport* Institution of Mechanical Engineers (IME), 2021-12-23. The transport sector continues to shift towards alternative powertrains, particularly with the UK Government's announcement to end the sale of petrol and diesel passenger cars by 2030 and increasing support for alternatives. Despite this announcement, the internal combustion continues to play a significant role both in the passenger car market through the use of hybrids and sustainable low carbon fuels as well as a key role in other sectors such as heavy duty vehicles and off-highway applications across the globe. Building on the industry leading IC Engines conference, the 2021 Powertrain Systems for Net Zero Transport conference, 7-8 December 2021, London, UK, focussed on the internal combustion engine's role in Net Zero transport as well as covered developments in the wide range of propulsion systems available: electric, fuel cell, sustainable fuels, etc. and their associated powertrains. To achieve the net zero transport across the globe, the life cycle analysis of future powertrain and energy was also discussed. Powertrain Systems for Net Zero Transport provided a forum for engine, fuels, e-machine, fuel cell and powertrain experts to look closely at developments in powertrain technology required to meet the demands of the net zero future and global competition in all sectors of the road transportation, off-highway and stationary power industries. *Automotive Control Systems* A.
