Autonomic Innervation of the Skin I. L. Gibbins, Judy L. Morris, 1997-12-12 The skin provides the major protective barrier between the internal milieu of the body and the external environment Moreover the skin together with its various components and appendages mediates many kinds of dynamic interactions with the outside world including thermoregulation camouflage behavioural displays and flight The mechanisms behind these interactions are all regulated by autonomic motor pathways this book reviews the current knowledge on the structure and function of autonomic nerves and associated sensory nerves in the skin in a range of vertebrates including the function of cutaneous autonomic nerves in humans in physiological states With eminent contributors from around the world this book forms an essential and comprehensive reference work for the area and is an important addition to this acclaimed series

It represents the largest collection of world wide autonomic nervous system authorities ever assembled in one book. It is especially suitable for students, scientists, and physicians seeking key information about all aspects of autonomic physiology and pathology in one convenient source. Providing up to date knowledge about basic and clinical autonomic neuroscience in a format designed to make learning easy and fun, this book is a must have for any neuroscientist's bookshelf. Greatly amplified and updated from previous edition including the latest developments in the field of autonomic cardiovascular regulation and neuroscience. Skin Dr. R. K. Freinkel, D.T. Woodley, 2001-03-15 An authoritative extensively illustrated clinician's textbook. The Biology of the Skin is written expressly for practitioners and residents in dermatology, plastic surgery, and otolaryngology. Essentially an expansion of the editors and contributing authors' popular Structure and Function course given annually at the meetings of the American Academy of Dermatology, the book teaches skin biology in the context of practical clinical settings. This book covers the basic biology of the skin, how the skin functions, effects of the environment, the molecules that direct cutaneous function, genetic influences, and methods in cutaneous research. The Biology of the Skin provides a selective review of all biologic processes involving the skin and will foster an appreciation of how the skin works based on our knowledge of the basic science of skin structure and function in the 21st century. The Neural Basis of Oral and Facial Function Ronald

Dubner, 2013-04-17 This book is a result of our combined major interests in oral and facial function. Since most of our research efforts have been concentrated on fundamental neural mechanisms, the book emphasizes basic research in this area. However, our backgrounds in clinical dentistry have always made us acutely aware of the relevance of these findings to clinical problems in dentistry and medicine, and such correlations are emphasized throughout the text. The term oral and facial function will here include the sensory and motor neural mechanisms of the face, mouth, pharynx, and larynx. Detailed discussions of nasal function, olfaction, and speech mechanisms have been omitted; these areas would encompass a book in themselves. A chapter on the subject of taste presents a brief overview in relation to other chapters in the book and clinical significance. We have not intended each chapter to be a review of the literature in a given area but have chosen to emphasize significant findings for total function of the area. References are limited to review articles whenever possible, and the reader is invited to search such reviews for original articles of interest. Where such reviews are not available, original articles are usually referenced so that the book provides a path to source material for those so inclined. Some of the chapters on special areas of interest such as teeth, periodontium, and jaw reflexes, however, are extensively referenced because of their unique relationship to the subject matter of the book. **Cutaneous Innervation** William Montagna, 2013-10-22 Advances in

Biology of Skin Vol I Cutaneous Innervation focuses on the biology of skin including the chemistry of the ground substance of the dermis to the biology of sebaceous glands The selection first offers information on the pattern of cutaneous innervation of the human hand foot and breast and similarities in cutaneous nerve end organs Discussions focus on the methods of study observations histochemical reactions and function of end organs The text then examines the autonomic innervation of the skin cholinesterases in the cutaneous nerves of man and the relation of nerve fiber size to modality of sensation The manuscript ponders on the central paths of the afferent impulses from skin that arouse sensation and studies related to the mechanism of common sensibility including materials and methods anatomical and physiological observations and interpretation of observations The publication also takes a look at the structures and processes involved in the sensation of itch and the pathophysiology of itch sensation The selection is a dependable reference for readers interested in the biology of skin
