Basic Cartography for Students and Technicians R. W. Anson, F. J. Ormeling, 1984 **Maps and the Internet** M.P. Peterson, International Cartographic Association, 2005-12-17 This book examines a new trend affecting cartography and geographic information science Presenting the work of over 30 authors from 16 different countries the book provides an overview of current research in the new area of Internet Cartography Chapters deal with the growth of this form of map distribution uses in education privacy issues and technical aspects from the point of view of the map provider including Internet protocols such as XML and SVG Many see the Internet as a revolution for cartography Previously tied to the medium of paper and expensive large format color print technology maps had a limited distribution and use The Internet made it possible to not only distribute maps to a much larger audience but also to incorporate interaction and animation in the display Maps have also become timelier with some maps of traffic and weather being updated every few minutes In addition it is now possible to access maps from servers throughout the world Finally the Internet has made historic maps available for viewing to the public that were previously only available in map libraries with limited access Provides comprehensive coverage of maps and the internet Delivers a global perspective Combines theoretical and practical aspects *Basic Cartography for Students and Technicians* International Cartographic Association, 1984 *Maps for the Future* László Zentai, Jesús Reyes Nunez, 2012-01-05 The joint symposium of ICA commissions is always one of the most important event for cartographers This joint seminar in Orleans was connected to 25th International Cartographic Conference Paris Works were presented by members of the commissions on Cartography and Children Cartographic Education and Training Maps and the Internet Planetary Cartography Early Warning and Disaster Management **Elements of Spatial Data Quality** S.C. Guptill, J.L. Morrison, 2013-10-22 Elements of Spatial Data Quality outlines the need and suggests potential categories for the content of a comprehensive statement of data quality that must be imbedded in the metadata that accompanies the transfer of a digital spatial data file or is available in a separate metadata catalog Members of the International Cartographic Association's Commission on Spatial Data Quality have identified seven elements of data quality positional accuracy attribute accuracy completeness logical consistency lineage semantic accuracy and temporal information In the book the authors describe components of each data quality element possible metrics that can be used to measure the quality of each criteria possible testing and rating schemes and how these parameters might differ from a producer or user point of view Finally no volume of this nature would be complete without a chapter devoted to necessary future research in this subject area The chapter points out areas in need of further investigation and speculates about the use and transfer of digital spatial data in tomorrow's electronic world and at developments in presenting specified data quality information in a visualization This book will be of interest to all of those individuals involved in geographical information systems and spatial data handling

Spatial Database Transfer Standards 2: Characteristics for Assessing Standards and Full Descriptions of the National and

International Standards in the World H. Moellering, R. Hogan, 1997-07-03 This book represents five and a half years of work by the ICA Commission on Standards for the Transfer of Spatial Data during the 1991-95 ICA cycle. The effort began with the Commission working to develop a set of scientific characteristics by which every kind of spatial data transfer standard could be understood and assessed. This implies that every facet of the transfer process must be understood so that the scientific characteristics could be most efficiently specified. The members of the Commission spent hours looking at their own standard and many others to ascertain how to specify most effectively the characteristic or subcharacteristic in question. The result is a set of internationally agreed scientific characteristics with 13 broad primary level classes of characteristics, 85 secondary characteristics, and about 220 tertiary characteristics that recognizes almost every possible capability that a spatial data transfer standard might have. It is recognized that no one standard possesses all of these characteristics but contains a subset of these characteristics. However, these characteristics have been specified in such a way to facilitate understanding of individual standards and use by interested parties of making comparisons for their own purposes. Although individual applications of a standard may be for different purposes, this set of characteristics provides a uniform measure by which the various standards may be assessed. The book presents an Introduction and four general chapters that describe the spatial data transfer standards activities happening in Europe, North America, Asia Pacific, and the ISO community. This provides the context so the reader can more easily understand the scientific and technical framework from which a particular standard has come. The third section is a complete listing of all of the three levels of characteristics and their meaning by the inclusion of a set of definitions for terms used in the book. The fourth section, and by far the largest, contains 22 chapters that assess each of the major national and international spatial data transfer standards in the world in terms of all three levels of characteristics. Each assessment has been done by a Commission member who has been an active participant in the development of the standard being assessed in the native language of that standard. A cross table chart is also provided.

Coordinate Systems and Map Projections D.H. Maling, 2013-10-22 A revised and expanded new edition of the definitive English work on map projections. The revisions take into account the huge advances in geometrical geodesy which have occurred since the early years of satellite geodesy. The detailed configuration of the geoid resulting from the GEOS and SEASAT altimetry measurements are now taken into consideration. Additionally, the chapter on computation of map projections is updated, bearing in mind the availability of pocket calculators and microcomputers. Analytical derivation of some map projections, including examples of pseudocylindrical and polyconic projections, is also covered. Work undertaken in the USA and USSR on the creation of suitable map projections obtained through numerical analysis has been included. The book concludes with a chapter on the abuse and misrepresentation of map projections. An invaluable reference source for

professional cartographers and all those interested in the fundamental problems of mapping the Earth **Cartography**

GIS And Generalisation J-P Lagrange, R Weibel, Jean-Claude Muller, 2020-11-25 This text is the inaugural book in Taylor

and Francis's GISDATA series and is derived from the specialist workshop convened under the auspices of the European Science Foundation's GISDATA Scientific Programme. Generalisation is an integrating tool for the analysis and presentation of spatial data. Effective spatial data analysis requires multiple views of the world at various scales with different thematic layers of representation. Generalisation is a key mechanism in this process as it filters out information which is required for particular scales or layers; hence it is critical to implement full and comprehensive generalisation capabilities in a GIS something with which few current GIS are equipped. This book overviews the core and as yet unresolved issues surrounding the achievement of this goal and presents various alternatives both speculative views and practical examples in the areas of automated generalisation via various problems such as object simplification and placement. At the same time it distinguishes between modelling with generalisation and graphical representation and adopts a model building perspective. It also describes artificial intelligence techniques for implementing automated generalised routines and addresses issues of data quality and production. The text is organized into six parts: an introduction, generic issue, object orientated methods and knowledge based modelling, knowledge acquisition and representation, data quality and operation, and implementation.
