well as dysfunction. It is also essential for understanding how receptors process information when impacted by such substances as heroin or nicotine or when affected by neurodegenerative disease. **Receptor Localization Laboratory Methods and Procedures** is the first user friendly guide to the latest techniques and approaches being employed to examine the localization of neurotransmitter receptors in the central nervous system and peripheral tissues. It covers detection methods that are applicable to a wide variety of receptor systems ranging from genes and ligands to in vitro receptors in individuals and to numerous receptor subtypes such as nicotine, muscarine, tachykinins, dopamine, adenosine and GABA. The standard laboratory recipes or tricks employed in these detection methods are fully discussed as are the advantages and limitations of each procedure. With contributions from leading experts and extensively illustrated, this book discusses receptor ligand binding methods using irreversible and reversible compounds. Presents anti-receptor antisera technology using synthetic peptides and fusion proteins at both the cellular and subcellular resolution levels. Examines molecular assessments of receptors. Describes in situ hybridization, reverse transcriptase PCR and fluorescent in situ transcription. Covers new visualization paradigms. Includes physiological analysis of receptor function, cellular detection in the brain slice and cultured neurons. Discusses the use of PET and SPECT to assess in vivo receptor distributions in animals and humans. **Receptor Localization Laboratory Methods and Procedures** is an invaluable guide for researchers in the related fields of neurology, biochemistry and pharmacology. Its lucid descriptions of new detection methods, inclusion of experimental examples and emphasis on how these experimental approaches are applicable to particular research areas will appeal to both the experienced researcher and novice investigator.

Protein Targeting Compounds Thomas Bödicke, 2016-05-28. This book presents an overview of the most relevant protein knockdown techniques. Readers will find a description of the generation and use of recombinant human antibodies, ER intrabodies and peptides as well as a description of the working mechanism and potential of the inhibitory action of each of these molecules. The book will also describe the selection and activity of a number of phosphatases, aptamers and allosteric modulators focusing on A G protein coupled receptors. The book starts with a chapter on the in silico prediction of target-inhibitor interactions. Key aspects of this book are: Selection strategies for monoclonal and recombinant human antibodies; Selection strategies for ER intrabodies, peptides and aptamers; Examples of the most efficient inhibitors and their applications in protein biochemistry and cell biology; Antibodies for cancer therapy and inhibitors of angiogenesis. The book will be of great interest to scientists and students working in the life sciences on all areas related to protein biology. The variety of methods to modulate the activities of specific proteins which are introduced here will be of great benefit to the reader who is interested in general protein research or to readers who have very specific protein related questions.
