Blind Equalization and System Identification Chong-Yung Chi,Chih-Chun Feng,Chii-Horng Chen,Ching-Yung Chen,2006-05-20 The absence of training signals from many kinds of transmission necessitates the widespread use of blind equalization and system identification There have been many algorithms developed for these purposes working with one or two dimensional signals and with single input single output or multiple input multiple output real or complex systems It is now time for a unified treatment of this subject pointing out the common characteristics of these algorithms as well as learning from their different perspectives Blind Equalization and System Identification provides such a unified treatment presenting theory performance analysis simulation implementation and applications This is a textbook for graduate courses in discrete time random processes statistical signal processing and blind equalization and system identification It contains material which will also interest researchers and engineers working in digital communications source separation speech processing and other similar applications

Digital Audio Restoration Simon J. Godsill,Peter J.W. Rayner,2013-12-21 The application of digital signal processing DSP to problems in audio has been an area of growing importance since the pioneering DSP work of the 1960s and 70s In the 1980s DSP micro chips became sufficiently powerful to handle the complex processing operations required for sound restoration in real time or close to real time This led to the first commer cially available restoration systems with

companies such as CEDAR Audio Ltd in the UK and Sonic Solutions in the US selling dedicated systems world wide to recording studios broadcasting companies media archives and film studios Vast amounts of important audio material ranging from historic recordings of the last century to relatively recent recordings on analogue or even digital tape media were noise reduced and re released on CD for the increasingly quality conscious music enthusiast Indeed the first restorations were a revelation in that clicks crackles and hiss could for the first time be almost completely eliminated from recordings which might otherwise be unreleasable in CD format Until recently however digital audio processing has required high powered computational engines which were only available to large institutions who could afford to use the sophisticated digital remastering technology With the advent of compact disc and other digital audio formats followed by the increased accessibility of home computing digital audio processing is now available to anyone who owns a PC with sound card and will be of increasing importance in association with digital video as the multimedia revolution continues into the next millennium

An Introduction to Text-to-Speech Synthesis Thierry Dutoit, 2013-12-01 An Introduction to Text to Speech Synthesis is a comprehensive introduction to the subject The author treats two areas of speech synthesis Part I of the book concerns natural language processing and the inherent problems it presents for speech synthesis Part II focuses on digital signal processing with an emphasis on the concatenative approach Both parts of the text guide the reader through the material in a step by step easy to follow way This is the first book to treat the topic of speech synthesis from the perspective of two different engineering approaches The book will be of interest to researchers and students in phonetics and speech communication in both academia and industry
