Cellular Neural Networks Gabriele Manganaro, Paolo Arena, Luigi Fortuna, 2012-12-06 The field of cellular neural networks CNNs is of growing importance in non linear circuits and systems and it is maturing to the point of becoming a new area of study in general nonlinear theory CNNs emerged through two semi nal papers co authored by Professor Leon O Chua back in 1988 Since then the attention that CNNs have attracted in the scientific community has been vast For instance there are international workshops dedicated to CNNs and their applications special issues published in both the International Journal of Circuit Theory and in the IEEE Transactions on Circuits and Systems and there are also Associate Editors appointed in the latter journal especially for the CNN field All of this bears witness the importance that CNNs are gaining within the scientific community Without doubt this book is a primer in the field Its extensive coverage provides the reader with a very comprehensive view of aspects involved in the theory and applications of cellular neural networks The authors have done an excellent job merging basic CNN theory synchronization spatio temporal phenomena and hardware implementation into eight exquisitely written chapters Each chapter is thoroughly illustrated with examples and case studies The result is a book that is not only excellent as a professional reference but also very appealing as a textbook My view is that students as well professional engineers will find this volume extremely useful

CMOS Data Converters for Communications Mikael Gustavsson, J. Jacob Wikner, Nianxiong Tan, 2005-12-15 CMOS Data Converters for Communications distinguishes itself from other data converter books by emphasizing system related aspects of the design and frequency domain measures It explains in detail how to derive data converter requirements for a given communication system baseband passband and multi carrier systems The authors also review CMOS data converter architectures and discuss their suitability for communications The rest of the book is dedicated to high performance CMOS data converter architecture and circuit design Pipelined ADCs

parallel ADCs with an improved passive sampling technique and oversampling ADCs are the focus for ADC architectures while current steering DAC modeling and implementation are the focus for DAC architectures The principles of the switched current and the switched capacitor techniques are reviewed and their applications to crucial functional blocks such as multiplying DACs and integrators are detailed The book outlines the design of the basic building blocks such as operational amplifiers comparators and reference generators with emphasis on the practical aspects To operate analog circuits at a reduced supply voltage special circuit techniques are needed Low voltage techniques are also discussed in this book CMOS Data Converters for Communications can be used as a reference book by analog circuit designers to understand the data converter requirements for communication applications It can also be used by telecommunication system designers to understand the difficulties of certain performance requirements on data converters It is also an excellent resource to prepare analog students for the new challenges ahead

Proceedings of the ... International Symposium on Microelectronics, 2000 *Cellular Neural Networks* Martin Hänggi, George S. Moschytz, 2000-08-31 Cellular Neural Networks CNNs constitute a class of nonlinear recurrent and locally coupled arrays of identical dynamical cells that operate in parallel ANALOG chips are being developed for use in applications where sophisticated signal processing at low power consumption is required Signal processing via CNNs only becomes efficient if the network is implemented in analog hardware In view of the physical limitations that analog implementations entail robust operation of a CNN chip with respect to parameter variations has to be insured By far not all mathematically possible CNN tasks can be carried out reliably on an analog chip some of them are inherently too sensitive This book defines a robustness measure to quantify the degree of robustness and proposes an exact and direct analytical design method for the synthesis of optimally robust network parameters The method is based on a design centering technique which is generally applicable where linear constraints have to be satisfied in an optimum way Processing speed is always crucial when discussing signal processing devices In the case of the CNN it is shown that the setting time can be specified in closed analytical expressions which permits on the one hand parameter optimization with respect to speed and on the other hand efficient numerical integration of CNNs Interdependence between robustness and speed issues are also addressed Another goal pursued is the unification of the theory of continuous time and discrete time systems By means of a delta operator approach it is proven that the same network parameters can be used for both of these classes even if their nonlinear output functions differ More complex CNN optimization problems that cannot be solved analytically necessitate resorting to numerical methods Among these stochastic optimization techniques such as genetic algorithms prove their usefulness for example in image classification problems Since the inception of the CNN the problem of finding the network parameters for a desired task has been regarded as a learning or training problem and computationally expensive methods derived from standard neural networks have been applied Furthermore numerous useful parameter sets have been derived by intuition In this book a direct and exact analytical design method for the network

parameters is presented The approach yields solutions which are optimum with respect to robustness an aspect which is crucial for successful implementation of the analog CNN hardware that has often been neglected This beautifully rounded work provides many interesting and useful results for both CNN theorists and circuit designers Leon O Chua
