Eyeing the Red Storm Robert M. Dienesch,2016-04 In 1954 the U S Air Force launched an ambitious program known as WS 117L to develop the world s first reconnaissance satellite The goal was to take photographic images from space and relay them back to Earth via radio Because of technical issues and bureaucratic resistance however WS 117L was seriously behind schedule by the time Sputnik orbited Earth in 1957 and was eventually cancelled The air force began concentrating instead on new programs that eventually launched the first successful U S spy satellites Eyeing the Red Storm examines the birth of space based reconnaissance not from the perspective of CORONA the first photo reconnaissance satellite to fly but rather from that of the WS 117L Robert M Dienesch s revised assessment places WS 117L within the larger context of Dwight D Eisenhower s presidency focusing on the dynamic between military and civilian leadership Dienesch demonstrates how WS 117L promised Eisenhower not merely military intelligence but also the capacity to manage national security against the Soviet threat As a fiscal conservative Eisenhower believed a strong economy was the key to surviving the Cold War and saw satellite reconnaissance as a means to understand the Soviet military challenge more clearly and thus keep American defense spending under control Although WS 117L never flew it provided the foundation for all subsequent satellites breaking theoretical barriers and helping to overcome major technical hurdles which ensured the success of America s first working reconnaissance satellites and their photographic missions during the Cold War Purchase the audio edition

The CIA and Congress David M. Barrett,2017-05-12 From its inception more than half a century ago and for decades afterward the Central Intelligence Agency was deeply shrouded in secrecy with little or no real oversight by Congress or so many Americans believe David M Barrett reveals however that

during the agency's first fifteen years Congress often monitored the CIA's actions and plans sometimes aggressively Drawing on a wealth of newly declassified documents research at some two dozen archives and interviews with former officials Barrett provides an unprecedented and often colorful account of relations between American spymasters and Capitol Hill He chronicles the CIA's dealings with senior legislators who were haunted by memories of our intelligence failure at Pearl Harbor and yet riddled with fears that such an organization might morph into an American Gestapo He focuses in particular on the efforts of Congress to monitor finance and control the agency's activities from the creation of the national security state in 1947 through the planning for the ill fated Bay of Pigs invasion in 1961 Along the way Barrett highlights how Congress criticized the agency for failing to predict the first Soviet atomic test the startling appearance of Sputnik over American air space and the overthrow of Iraq's pro American government in 1958 He also explores how Congress viewed the CIA's handling of Senator McCarthy's charges of communist infiltration the crisis created by the downing of a U 2 spy plane and President Eisenhower's complaint that Congress meddled too much in CIA matters Ironically as Barrett shows Congress itself often pushed the agency to expand its covert operations against other nations The CIA and Congress provides a much needed historical perspective for current debates in Congress and beyond concerning the agency's recent failures and ultimate fate In our post 9 11 era it shows that anxieties over the challenges to democracy posed by our intelligence communities have been with us from the very beginning

Molecular Anatomy of Cellular Systems I. Endo, I. Yamaguchi, T. Kudo, H. Osada, T. Shibata, 2002-08-20 In this book the progress during the last ten years is reviewed and future plans outlined to realize and establish the concept of design in the biological sciences Design is a leading concept as well as the principal motivation for the creation of artificial systems A successful design generally requires that the structures and functions of the elements that constitute the system as well as the principles that determine how the elements cooperate together to create function be fully understood These requirements have not been satisfied

within the fields of biotechnology and medicine Compared to the recent emergence of artificial systems living organisms acquired their present day structures and functions through evolution over three to four billion years Despite the fact that the design of living organisms is recorded in the DNA sequence our understanding of the structures and functions of the elements that constitute living organisms is very limited To fulfill the requirements the following approaches were initiated under a ten year project entitled Biodesign Research Firstly we tried to isolate and characterize the functional elements that constitute the organelles of various organisms Secondly we tried to reconstitute systems that reproduce biological functions in vitro from individual elements in order to understand how the elements cooperate together to yield a function Thirdly we attempted to resolve biological structures at various resolutions ranging from the atomic to the cellular level to further our knowledge about the fundamental principles that various functions at the molecular level and to design artificial systems
