## **Alternatives For Ground Water Cleanup:**

Alternatives for Ground Water Cleanup National Research Council, Division on Earth and Life Studies, Commission on Geosciences, Environment and Resources, Committee on Ground Water Cleanup Alternatives, 1994-02-01 There may be nearly 300 000 waste sites in the United States where ground water and soil are contaminated Yet recent studies question whether existing technologies can restore contaminated ground water to drinking water standards which is the goal for most sites and the result expected by the public How can the nation balance public health technological realities and cost when addressing ground water cleanup This new volume offers specific conclusions outlines research needs and recommends policies that are technologically sound while still protecting health and the environment Authored by the top experts from industry and academia this volume Examines how the physical chemical and biological characteristics of the subsurface environment as well as the properties of contaminants complicate the cleanup task Reviews the limitations of widely used conventional pump and treat cleanup systems including detailed case studies Evaluates a range of innovative cleanup technologies and the barriers to their full implementation Presents specific recommendations for policies and practices in evaluating contamination sites in choosing remediation technologies and in setting appropriate cleanup goals **Alternatives for Ground Water Cleanup**, 19?? **Alternatives for Managing the Nation's Complex Contaminated Groundwater Sites** National Research Council, Division on Earth and Life Studies, Water Science and Technology Board, Committee on Future Options for Management in the Nation's Subsurface Remediation Effort, 2013-03-27 Across the United States thousands of hazardous waste sites are contaminated with chemicals that prevent the underlying groundwater from meeting drinking water standards These include Superfund sites and other facilities that handle and dispose of hazardous waste active and inactive dry cleaners and leaking underground storage tanks many are at federal facilities such as military installations While many sites have been closed over the past 30 years through cleanup programs run by the U S Department of Defense the U S EPA and other state and federal agencies the remaining caseload is much more difficult to address because the nature of the contamination and subsurface conditions make it difficult to achieve drinking water standards in the affected groundwater **Alternatives for Managing the Nation's Complex Contaminated Groundwater Sites** estimates that at least 126 000 sites across the U S still have contaminated groundwater and their closure is expected to cost at least 110 billion to 127 billion About 10 percent of these sites are considered complex meaning restoration is unlikely to be achieved in the next 50 to 100 years due to technological limitations At sites where contaminant concentrations have plateaued at levels above cleanup goals despite active efforts the report recommends evaluating whether the sites should transition to long term management where risks would be monitored and harmful exposures prevented but at reduced costs **Handbook of Groundwater Protection and Cleanup Policies for RCRA Corrective Action**, 2002 **Reclamation of the Uranium Mill Tailings at the Atlas Site, Moab, Utah**, 1999 *Guidance on Feasibility Studies Under CERCLA*, 1985

Handbook of Groundwater Remediation using Permeable Reactive Barriers David Naftz, Stan J. Morrison, Christopher C. Fuller, James A. Davis, 2002-10-17 Over the last century and a half groundwaters have become contaminated by a growing number of organic and inorganic substances ranging from petroleum derived hydrocarbons to radioactive compounds to cancer causing hexavalent chromium The importance of uncontaminated groundwater for agriculture human consumption and the environmental health of ecosystems is paramount to the health and productivity of industrial society Water scientists and managers are focused on developing cost effective methods to reverse this trend Several methodologies have been developed however few are as cost effective as the use of readily available materials such as iron and organic compost for absorbing and isolating contaminants within the matrix of a permeable barrier The Handbook of Groundwater Remediation using Permeable Reactive Barriers presents readers with this latest technology and developments within four main sections 1 Innovations in Design Construction and Evaluation of PRBs2 Development of Reactive Materials3 Evaluations of Chemical and Biological Processes4 Case Studies of Permeable Reactive Barrier InstallationsThe Handbook is one of the first references specifically on this topic It is an excellent fit for graduate students entering this emerging field as well as professionals conducting research or implementing this technology
