Algorithms A Creative Approach:

Introduction to Algorithms Udi Manber, 1989 **Algorithms: Design Techniques And Analysis (Revised Edition)** M H Alsuwaiyel, 2016-02-16 Problem solving is an essential part of every scientific discipline It has two components 1 problem identification and formulation and 2 the solution to the formulated problem One can solve a problem on its own using ad hoc techniques or by following techniques that have produced efficient solutions to similar problems This requires the understanding of various algorithm design techniques how and when to use them to formulate solutions and the context appropriate for each of them Algorithms Design Techniques and Analysis advocates the study of algorithm design by presenting the most useful techniques and illustrating them with numerous examples emphasizing on design techniques in problem solving rather than algorithms topics like searching and sorting Algorithmic analysis in connection with example algorithms are explored in detail Each technique or strategy is covered in its own chapter through numerous examples of problems and their algorithms Readers will be equipped with problem solving tools needed in advanced courses or research in science and engineering Creative Approaches Towards Development of Computing and Multidisciplinary IT Solutions for Society Anchit Bijalwan, Rick Bennett, Jyotsna G. B., Sachi Nandan Mohanty, 2024-08-28 This book containing 33 chapters provides an insightful look at creative approaches toward the accelerated development of computing and multidisciplinary IT solutions for society Technology is advancing on all fronts and is opening new and innovative adaptations to our modern world every single day causing huge shifts in practices and patterns These new technologies allow us opportunities to gain insights into the discoveries of creative and innovative approaches The book covers emerging next generation computing research developments of computing and multidisciplinary ICT solutions in seven themes The first theme concerns the emerging research into next generation computing like cloud computing cyber security and gaming The second theme pertains to information technology in the textile industry The third theme zeroes in on the adoption of ICT for digitalization artificial intelligence and machine learning The fourth theme addresses online collaboration in the creative process The fifth theme covers the development of computing and multidisciplinary ICT solutions for salient disciplines like education governance commerce and business communication The sixth theme provides a security assessment and defense strategies for banking and financial institutions The seventh theme covers creative approaches towards the implementation of the 4th Industrial Revolution Audience The book has a wide audience comprising specialists in artificial intelligence information technology software engineers data and cyber security scientists as well as those in the applied areas such as business finance industry and manufacturing Policymakers and consultants will find this book useful as well **Algorithms** M. H. Alsuwaiyel, 1999 Problem solving is an essential part of every scientific discipline It has two components 1 problem identification and formulation and 2 solution of the formulated problem One can solve a problem on its own using ad hoc techniques or follow those techniques that have produced efficient solutions to similar problems This requires the

understanding of various algorithm design techniques how and when to use them to formulate solutions and the context appropriate for each of them This book advocates the study of algorithm design techniques by presenting most of the useful algorithm design techniques and illustrating them through numerous examples

Generating Creative Language - Theories, Practice and Evaluation Mika Hämmäläinen, 2020-10-08 This thesis presents approaches to computationally creative natural language generation focusing on theoretical foundations practical solutions and evaluation I defend that a theoretical definition is crucial for computational creativity and that the practical solution must closely follow the theoretical definition Finally evaluation must be based on the underlying theory and what was actually modelled in the practical solution A theoretical void in the existing theoretical work on computational creativity is identified The existing theories do not explicitly take into account the communicative nature of natural language Therefore a new theoretical framework is elaborated that identifies how computational creativity can take place in a setting that has a clear communicative goal This introduces a communicative creative trade off that sets limits to creativity in such a communicative context My framework divides creativity in three categories message creativity contextual creativity and communicative creativity Any computationally creative NLG approach not taking communicativity into account is called mere surface generation I propose a novel master apprentice approach for creative language generation The approach consists of a genetic algorithm the fitness functions of which correspond to different parameters defined as important for the creative task in question from a theoretical perspective The output of the genetic algorithm together with possible human authored data are used to train the apprentice which is a sequence to sequence neural network model The role of the apprentice in the system is to approximate creative autonomy Evaluation is approached from three different perspectives in this work ad hoc and abstract theory based and abstract and theory based and concrete The first perspective is the most common one in the current literature and its shortcomings are demonstrated and discussed This starts a gradual shift towards more meaningful evaluation by first using proper theories to define the task being modelled and finally reducing the room for subjective

interpretation by suggesting the use of concrete evaluation questions

The Rise of Metacreativity Eduardo

Navas,2022-11-18 This book brings together history and theory in art and media to examine the effects of artificial intelligence and machine learning in culture and reflects on the implications of delegating parts of the creative process to AI In order to understand the complexity of authorship and originality in relation to creativity in contemporary times Navas combines historical and theoretical premises from different areas of research in the arts humanities and social sciences to provide a rich historical and theoretical context that critically reflects on and questions the implications of artificial intelligence and machine learning as an integral part of creative production As part of this the book considers how much of postproduction and remix aesthetics in art and media preceded the current rise of metacreativity in relation to artificial intelligence and machine learning and explores contemporary questions on aesthetics The book also provides a thorough evaluation of the creative application of systematic approaches to art and media production and how this in effect percolates across disciplines including art design communication as well as other fields in the humanities and social sciences An essential read for students and scholars interested in understanding the increasing role of AI and machine learning in contemporary art and media and their wider role in creative production across culture and society

Algorithmics for Hard Problems Juraj

Hromkovič,2013-03-14 Algorithmic design especially for hard problems is more essential for success in solving them than any standard improvement of current computer technologies Because of this the design of algorithms for solving hard problems is the core of current algorithmic research from the theoretical point of view as well as from the practical point of view There are many general text books on algorithmics and several specialized books devoted to particular approaches such as local search randomization approximation algorithms or heuristics But there is no textbook that focuses on the design of algorithms for hard computing tasks and that systematically explains combines and compares the main possibilities for attacking hard algorithmic problems As this topic is fundamental for computer science this book tries to close this gap Another motivation and probably the main reason for writing this book is connected to education The considered area has developed very dynamically in recent years and the research on this topic discovered several profound results new concepts and new methods Some of the achieved contributions are so fundamental that one can speak about paradigms which should be included in the education of every computer science student Unfortunately this is very far from reality This is because these paradigms are not sufficiently known in the computer science community and so they are insufficiently communicated to students and practitioners
