## **Aggregation In Largescale Optimization:**

Aggregation in Large-Scale Optimization I. Litvinchev, Vladimir Tsurkov, 2003-09-30 When analyzing systems with a large number of parameters the dimension of the original system may present insurmountable difficulties for the analysis It may then be convenient to reformulate the original system in terms of substantially fewer aggregated variables or macrovariables In other words an original system with an  $n$  dimensional vector of states is reformulated as a system with a vector of dimension much less than  $n$  The aggregated variables are either readily defined and processed or the aggregated system may be considered as an approximate model for the original system In the latter case the operation of the original system can be exhaustively analyzed within the framework of the aggregated model and one faces the problems of defining the rules for introducing macrovariables specifying loss of information and accuracy recovering original variables from aggregates etc We consider also in detail the so called iterative aggregation approach It constructs an iterative process at every step of which a macroproblem is solved that is simpler than the original problem because of its lower dimension Aggregation weights are then updated and the procedure passes to the next step Macrovariables are commonly used in coordinating problems of hierarchical optimization

**Large-scale Optimization**

Vladimir Tsurkov, 2001-03-31 Decomposition methods aim to reduce large scale problems to simpler problems This monograph presents selected aspects of the dimension reduction problem Exact and approximate aggregations of multidimensional systems are developed and from a known model of input output balance aggregation methods are categorized The issues of loss of accuracy recovery of original variables disaggregation and compatibility conditions are analyzed in detail The method of iterative aggregation in large scale problems is studied For fixed weights successively simpler aggregated problems are solved and the convergence of their solution to that of the original problem is analyzed An

introduction to block integer programming is considered Duality theory which is widely used in continuous block programming does not work for the integer problem A survey of alternative methods is presented and special attention is given to combined methods of decomposition Block problems in which the coupling variables do not enter the binding constraints are studied These models are worthwhile because they permit a decomposition with respect to primal and dual variables by two level algorithms instead of three level algorithms Audience This book is addressed to specialists in operations research optimization and optimal control

**Solving Network Design Problems via Decomposition, Aggregation and Approximation** Andreas

Bärmann,2016-06-02 Andreas Bärmann develops novel approaches for the solution of network design problems as they arise in various contexts of applied optimization At the example of an optimal expansion of the German railway network until 2030 the author derives a tailor made decomposition technique for multi period network design problems Next he develops a general framework for the solution of network design problems via aggregation of the underlying graph structure This approach is shown to save much computation time as compared to standard techniques Finally the author devises a modelling framework for the approximation of the robust counterpart under ellipsoidal uncertainty an often studied case in the literature Each of these three approaches opens up a fascinating branch of research which promises a better theoretical understanding of the problem and an increasing range of solvable application settings at the same time Sustainable

*Hierarchical Decision Making in Stochastic Manufacturing Systems* Suresh P. Sethi,Qing Zhang,2012-12-06 One of the most important methods in dealing with the optimization of large complex systems is that of hierarchical decomposition The idea is to reduce the overall complex problem into manageable approximate problems or subproblems to solve these problems and to construct a solution of the original problem from the solutions of these simpler problems Development of such approaches for large complex systems has been identified as a particularly fruitful area by the Committee on the Next Decade in Operations Research 1988 42 as well as by the Panel on Future Directions in Control Theory 1988 65 Most

manufacturing firms are complex systems characterized by several decision subsystems such as finance personnel marketing and operations They may have several plants and warehouses and a wide variety of machines and equipment devoted to producing a large number of different products Moreover they are subject to deterministic as well as stochastic discrete events such as purchasing new equipment hiring and layoff of personnel and machine setups failures and repairs
