Soft Computing , 2005 **Artificial Intelligence and Instruction** William D. Milheim, 1989 **Organizations as Complex Systems** Maurice Yolles, 2006-09-01 Managing the Complex is an ambitious title and it would be an audacious one if we were not to begin with a frank admission to date few to none of us have a skill set which includes managing the complex We try various things we write about others and we wonder about still others When a tool perspective or technique comes along which seems to evoke success we emulate it probe it and recoil at the all too often admission that it was situation and context which afforded success its opportunity and not some quality intrinsic to the tool perspective or technique Indeed if the study of complexity has done anything for managers and for those who espouse managerial theory it is in providing a scientific foundation for the notion that context matters Those who preach abstract ideas have then to reconcile themselves to the notion that situation and embodiment matters Those who believe in strong causality and determinism are left to wrestle with the role of chance uncertainty and chaos Those who

prefer to argue that men move history are confronted with the role of environment and affordances while those who argue the reverse are left to contend with charisma irrationality of crowds and the strange qualities we know as emotions A series on complex systems has less ambitious goals to contend with than this Such a series can deal with classifications and categories and speak of noise as if it were not the central focus of the problem Managing the complex is about managing noise or perhaps we should say it is about dealing with accepting making room for and learning from noise The articles in this volume and in volumes to come will each be considered as noise by some and as gems by others but we hope that practicing managers and academics alike will find plenty of fuel to drive their personal explorations into understanding and perhaps even managing the complex Intelligent Spatial Decision Support Systems Yee Leung, 2012-12-06 In the past half century we have experienced two major waves of methodological development in the study of human behavior in space and time The first wave was the well known quantitative revolution which propelled geography from a mainly descriptive discipline to a scientific discipline using formalism such as probability statistics and a large number of mathematical methods for analyzing spatial structures and processes under certainty and uncertainty The second wave is the recent advancement of geographical information systems which equips geographers with automation in the storage retrieval analysis and display of data Both developments have significant impacts on geographical studies in general and solutions to real life spatio temporal problems in particular They have found applications in urban and regional planning automated mapping and facilities management transportation planning and management as well as environmental planning and management to name but a few examples Both developments have one thing in common They one way or the other use computer to process and analyze data However not until recently there has been very little interaction between the two Quantitative models have largely been developed independent of the underlying data models and structures representing the spatial phenomena or processes under study Display of analysis results has been primitive in terms of the utilization of computer graphic technologies Formal models in addition to their technical difficulties have poor capability in communication with users Geographical information systems on the other hand have originally been developed with a slight intention to entertain powerful analytical models
