Basic of Biochemistry Dr. Kavita Rawat, Dr. Amit Kumar Singh, Arpan Debnath, Dr. Jyotsana Shakkarpude, 2024-09-21 Biochemistry is the study of the chemical processes within and related to living organisms It is a laboratory based science that brings together biology and chemistry By using chemical knowledge and techniques biochemists can understand and solve biological problems One of the core concepts in biochemistry is the structure and function of biomolecules These include proteins carbohydrates lipids and nucleic acids Proteins for example are essential for a variety of cellular processes such as enzyme catalysis structural support and transport Carbohydrates provide energy for cells while lipids store energy and form cell membranes Nucleic acids DNA and RNA carry genetic information Another important area of biochemistry is metabolism Metabolic pathways involve a series of chemical reactions that allow organisms to obtain and use energy For instance cellular respiration is a metabolic process that breaks down glucose to produce ATP the energy currency of the cell Photosynthesis is another metabolic process that uses sunlight to convert carbon dioxide and water into glucose Biochemists also study the regulation of cellular processes This involves understanding how cells respond to signals and how they control gene expression By studying these processes researchers can develop new treatments for diseases such as cancer and diabetes
