

Probabilistic Programming

The programming languages and machine learning communities have, over the last few years, developed a shared set of research interests under the umbrella of [probabilistic programming](#). The idea is that we might be able to “export” powerful PL concepts like abstraction and reuse to statistical modeling, which is currently an arcane and arduous task.

1. What and Why

1.1. Probabilistic Programming is Not

Counterintuitively, probabilistic programming is *not* about writing software that behaves probabilistically. For example, if your program calls `rand(3)` as part of the work it’s intended to do—as in a cryptographic key generator, or an [ASLR](#) implementation in an OS kernel, or even a [simulated-annealing](#) optimizer for circuit designs—that’s all well and good, but it’s not what this topic is about.

It’s best not to think of “writing software” at all. By way of analogy, traditional languages like C++, Haskell, and Python are obviously very different in philosophy, but you can imagine (if forced) using any of them to write, say, a cataloging system for your cat pictures or a great new alternative to LaTeX. One might be better for a given domain than the other, but they’re all workable. Not so with probabilistic programming languages (PPL). It’s more like Prolog: sure, it’s a programming language—but it’s not the right tool for writing full-fledged software.

1.2. Probabilistic Programming Is

Instead, probabilistic programming is *a tool for statistical modeling*. The idea is to borrow lessons from the world of programming languages and apply them to the problems of designing and using statistical models. Experts construct statistical models already—by hand, in mathematical notation on paper—but it’s an expert-only process that’s hard to support with mechanical reasoning. The key insight in PP is that statistical modeling can, when you do it enough, start to feel a lot like programming. If we make the leap and actually use a real language for our modeling, many new tools become feasible. We can start to automate the tasks that used to justify writing a paper for each instance.

Here’s a second definition: a probabilistic programming language is an ordinary programming language with *rand* and a great big pile of related tools that help you understand the program’s statistical behavior.

Both of these definitions are accurate. They just emphasize different angles on the same core idea. Which one makes sense to you will depend on what you want to use PP for. But don’t get distracted by the fact that PPL programs look a lot like ordinary software implementations, where the
