Algebraic Topology C. T. J. Dodson,C.T. Dodson,P.E. Parker,Phillip E. Parker,1997-01-31 This book arose from courses taught by the authors and is designed for both instructional and reference use during and after a first course in algebraic topology It is a handbook for users who want to calculate but whose main interests are in applications using the current literature rather than in developing the theory Typical areas of applications are differential geometry and theoretical physics We start gently with numerous pictures to illustrate the fundamental ideas and constructions in homotopy theory that are needed in later chapters We show how to calculate homotopy groups homology groups and cohomology rings of most of the major theories exact homotopy sequences of fibrations some important spectral sequences and all the obstructions that we can compute from these Our approach is to mix illustrative examples with those proofs that actually develop transferable calculational aids We give extensive appendices with notes on background material extensive tables of data and a thorough index Audience Graduate students and professionals in mathematics and physics Elements of Differential Topology Anant R. Shastri,2011-03-04 Derived from the author s course on the subject Elements of Differential Topology explores the vast and elegant theories in topology developed by Morse Thom Smale Whitney Milnor and others It begins with differential and integral calculus leads you through the intricacies of manifold theory and concludes with discussions on algebraic topol

Topological Fixed Point Theory of Multivalued Mappings Lech Górniewicz, 2013-11-11 This book is an attempt to give a systematic presentation of results and methods which concern the fixed point theory of multivalued mappings and some of its applications In selecting the material we have restricted ourselves to studying topological methods in the fixed point theory of multivalued mappings and applications mainly to differential inclusions Thus in Chapter III the approximation on the graph method in fixed point theory of multivalued mappings is presented Chapter IV is devoted to the homological methods and contains more general results e g the Lefschetz Fixed Point Theorem the fixed point index and the topological degree theory In Chapter V applications to some special problems in fixed point theory are formulated Then in the last chapter a direct applications to differential inclusions are presented Note that Chapter I and Chapter II have an auxiliary character and only results connected with the Banach Contraction Principle see Chapter II are strictly related to topological methods in the fixed point theory In the last section of our book see Section 75 we give a bibliographical guide and also signal some further results which are not contained in our monograph The author thanks several colleagues and my wife Maria who read and commented on the manuscript These include J Andres A Buraczewski G Gabor A Gorka M Gorniewicz S Park and A Wieczorek The author wish to express his gratitude to P Konstanty for preparing the electronic version of this monograph

Principal Structures and Methods of Representation Theory Dmitrii Petrovich Zhelobenko, The main topic of this book can be described as the theory of algebraic and topological structures admitting natural representations by operators in vector spaces These structures include topological algebras Lie algebras topological groups and Lie groups The book is divided into three parts Part I surveys general facts for beginners including linear algebra and functional analysis Part II considers associative algebras Lie algebras topological groups and Lie groups along with some aspects of ring theory and the theory of algebraic groups The author provides a detailed account of classical results in related branches of mathematics such as invariant integration and Lie's theory of connections between Lie groups and Lie algebras Part III discusses semisimple Lie algebras and Lie groups Banach algebras and quantum groups This is a useful text for a wide range of specialists including graduate students and researchers working in mathematical physics and specialists interested in modern

representation theory It is suitable for independent study or supplementary reading Also available from the AMS by this acclaimed author is *Compact Lie Groups and Their Representations* *Symplectic Geometry* A.T. Fomenko, 1995-11-30

Geometry of Vector Sheaves Anastasios Mallios, 1998 This text is part of a two volume monograph which obtains fundamental notions and results of the standard differential geometry of smooth manifolds without using differential calculus Here the sheaf theoretic character is emphasized This has theoretical advantages such as greater perspective clarity and unification but also practical benefits ranging from elementary particle physics via gauge theories and theoretical cosmology differential spaces to non linear PDEs generalized functions Thus more general applications which are no longer smooth in the classical sense can be coped with The treatise might also be construed as a new systematic endeavour to confront the ever increasing notion that the world around us is far from being smooth enough *The Structure of Classical*

Diffeomorphism Groups Augustin Banyaga, 2013-03-14 In the 60 s the work of Anderson Chernavski Kirby and Edwards showed that the group of homeomorphisms of a smooth manifold which are isotopic to the identity is a simple group This led Smale to conjecture that the group $\text{Diff } M$ of C^r diffeomorphisms $r \geq 1$ of a smooth manifold M with compact supports and isotopic to the identity through compactly supported isotopies is a simple group as well In this monograph we give a fairly detailed proof that $\text{Diff } M$ is a simple group This theorem was proved by Herman in the case M is the torus $\mathbb{T}^n$ in 1971 as a consequence of the Nash Moser Sergeraert implicit function theorem Thurston showed in 1974 how Herman's result on $\mathbb{T}^n$ implies the general theorem for any smooth manifold M The key idea was to vision an isotopy in $\text{Diff } M$ as a foliation on $M \times [0, 1]$ In fact he discovered a deep connection between the local homology of the group of diffeomorphisms and the homology of the Haefliger classifying space for foliations Thurston's paper 180 contains just a brief sketch of the proof The details have been worked out by Mather 120 124 125 and the author 12 This circle of ideas that we call the Thurston tricks is discussed in chapter 2 It explains how in certain groups of diffeomorphisms perfectness leads to simplicity In connection with these ideas we discuss Epstein's theory 52 which we apply to contact diffeomorphisms in chapter 6 **A First Course in Geometric**

Topology and Differential Geometry Ethan D. Bloch, 2011-06-27 The uniqueness of this text in combining geometric topology and differential geometry lies in its unifying thread the notion of a surface With numerous illustrations exercises and examples the student comes to understand the relationship of the modern abstract approach to geometric intuition The text is kept at a concrete level avoiding unnecessary abstractions yet never sacrificing mathematical rigor The book includes topics not usually found in a single book at this level *Hamiltonian Mechanical Systems and Geometric Quantization*

Mircea Puta, 2012-12-06 This volume presents various aspects of the geometry of symplectic and Poisson manifolds and applications in Hamiltonian mechanics and geometric quantization are indicated Chapter 1 presents some general facts about symplectic vector space symplectic manifolds and symplectic reduction Chapter 2 deals with the study of Hamiltonian mechanics Chapter 3 considers some standard facts concerning Lie groups and algebras which lead to the theory of

momentum mappings and the Marsden Weinstein reduction Chapters 4 and 5 consider the theory and the stability of equilibrium solutions of Hamilton Poisson mechanical systems Chapters 6 and 7 are devoted to the theory of geometric quantization This leads in Chapter 8 to topics such as foliated cohomology the theory of the Dolbeault Kostant complex and their applications A discussion of the relation between geometric quantization and the Marsden Weinstein reduction is presented in Chapter 9 The final chapter considers extending the theory of geometric quantization to Poisson manifolds via the theory of symplectic groupoids Each chapter concludes with problems and solutions many of which present significant applications and in some cases major theorems For graduate students and researchers whose interests and work involve symplectic geometry and Hamiltonian mechanics

Differentiable and Complex Dynamics of Several Variables Pei-Chu Hu, Chung-Chun Yang, 2013-04-17 The development of dynamics theory began with the work of Isaac Newton In his theory the most basic law of classical mechanics is $f = ma$ which describes the motion n in $\mathbb{R}^n$ of a point of mass m under the action of a force f by giving the acceleration a If n the position of the point is taken to be a point $x \in \mathbb{R}^n$ and if the force f is supposed to be a function of x only Newton's Law is a description in terms of a second order ordinary differential equation $J^2x = m \frac{d^2x}{dt^2} = f(x)$ It makes sense to reduce the equations to first order by defining the velocity as an extra independent variable by $v \in \mathbb{R}^n$ Then $x, v \in \mathbb{R}^{2n}$ Euler J L Lagrange and others studied mechanics by means of an analytical method called analytical dynamics Whenever the force f is represented by a gradient vector field $f = -\nabla U$ of the potential energy U and denotes the difference of the kinetic energy and the potential energy by $L = \frac{1}{2}mv^2 - U(x)$ the Newton equation of motion is reduced to the Euler Lagrange equation are used as the variables the Euler Lagrange equation can be written as $\frac{d}{dt} \frac{\partial L}{\partial v} = \frac{\partial L}{\partial x}$ If the momenta y written as $y = \frac{\partial L}{\partial v}$ Further W R Partial Differential Equations and Group Theory J.F. Pommaret, 2013-03-09 Ordinary differential control theory the classical theory studies input output relations defined by systems of ordinary differential equations ODE The various concepts that can be introduced controllability observability invertibility etc must be tested on formal objects matrices vector fields etc by means of formal operations multiplication bracket rank etc but without appealing to the explicit integration search for trajectories etc of the given ODE Many partial results have been recently unified by means of new formal methods coming from differential geometry and differential algebra However certain problems invariance equivalence linearization etc naturally lead to systems of partial differential equations PDE More generally partial differential control theory studies input output relations defined by systems of PDE mechanics thermodynamics hydrodynamics plasma physics robotics etc One of the aims of this book is to extend the preceding concepts to this new situation where of course functional analysis and or a dynamical system approach cannot be used A link will be exhibited between this domain of applied mathematics and the famous Backlund problem existing in the study of solitary waves or solitons In particular we shall show how the methods of differential elimination presented here will allow us to determine compatibility conditions on input and or output as a better understanding of the foundations of control theory At the same time we shall unify differential

geometry and differential algebra in a new framework called differential algebraic geometry Lightlike Submanifolds of Semi-Riemannian Manifolds and Applications Krishan L. Duggal, Aurel Bejancu, 2013-04-17 This book is about the light like degenerate geometry of submanifolds needed to fill a gap in the general theory of submanifolds The growing importance of light like hypersurfaces in mathematical physics in particular their extensive use in relativity and very limited information available on the general theory of lightlike submanifolds motivated the present authors in 1990 to do collaborative research on the subject matter of this book Based on a series of author s papers Bejancu 3 Bejancu Duggal 1 3 Dug gal 13 Duggal Bejancu 1 2 3 and several other researchers this volume was conceived and developed during the Fall 91 and Fall 94 visits of Bejancu to the University of Windsor Canada The primary difference between the lightlike submanifold and that of its non degenerate counterpart arises due to the fact that in the first case the normal vector bundle intersects with the tangent bundle of the submanifold Thus one fails to use in the usual way the theory of non degenerate submanifolds cf Chen 1 to define the induced geometric objects such as linear connection second fundamental form Gauss and Weingarten equations on the light like submanifold Some work is known on null hypersurfaces and degenerate submanifolds see an up to date list of references on pages 138 and 140 respectively Our approach in this book has the following outstanding features a It is the first ever attempt of an up to date information on null curves lightlike hypersur faces and submanifolds consistent with the theory of non degenerate submanifolds **Complexes of Differential Operators** Nikolai Tarkhanov, 2012-12-06 This book gives a systematic account of the facts concerning complexes of differential operators on differentiable manifolds The central place is occupied by the study of general complexes of differential operators between sections of vector bundles Although the global situation often contains nothing new as compared with the local one that is complexes of partial differential operators on an open subset of $\mathbb{R}^n$ the invariant language allows one to simplify the notation and to distinguish better the algebraic nature of some questions In the last 2 decades within the general theory of complexes of differential operators the following directions were delineated 1 the formal theory 2 the existence theory 3 the problem of global solvability 4 overdetermined boundary problems 5 the generalized Lefschetz theory of fixed points and 6 the qualitative theory of solutions of overdetermined systems All of these problems are reflected in this book to some degree It is superfluous to say that different directions sometimes whimsically intersect Considerable attention is given to connections and parallels with the theory of functions of several complex variables One of the reproaches avowed beforehand by the author consists of the shortage of examples The framework of the book has not permitted their number to be increased significantly Certain parts of the book consist of results obtained by the author in 1977 1986 They have been presented in seminars in Krasnoyarsk Moscow Ekaterinburg and Novosibirsk **Vector Bundles and Their Applications** Glenys Luke, Alexander S. Mishchenko, 2013-03-09 The book is devoted to the basic notions of vector bundles and their applications The focus of attention is towards explaining the most important notions and geometric constructions connected with the theory of vector

bundles Theorems are not always formulated in maximal generality but rather in such a way that the geometric nature of the objects comes to the fore Whenever possible examples are given to illustrate the role of vector bundles Audience With numerous illustrations and applications to various problems in mathematics and the sciences the book will be of interest to a range of graduate students from pure and applied mathematics *Smooth Quasigroups and Loops* L. Sabinin, 2012-12-06 During the last twenty five years quite remarkable relations between nonassociative algebra and differential geometry have been discovered in our work Such exotic structures of algebra as quasigroups and loops were obtained from purely geometric structures such as affinely connected spaces The notion of module was introduced as a fundamental algebraic invariant of differential geometry For any space with an affine connection loop, scalar, modular and geomodular structures partial smooth algebras of a special kind were introduced and studied As it happened the natural geomodular structure of an affinely connected space allows us to reconstruct this space in a unique way Moreover any smoothly abstractly given geomodular structure generates in a unique manner an affinely connected space with the natural geomodular structure isomorphic to the initial one The above said means that any affinely connected in particular Riemannian space can be treated as a purely algebraic structure equipped with smoothness Numerous habitual geometric properties may be expressed in the language of geomodular structures by means of algebraic identities etc Our treatment has led us to the purely algebraic concept of affinely connected in particular Riemannian spaces for example one can consider a discrete or even finite space with affine connection in the form of geomodular structure which can be used in the old problem of discrete space time in relativity essential for the quantum space time theory **Digital Geometry** Reinhard Klette, Azriel Rosenfeld, 2004-08-06 The first book on digital geometry by the leaders in the field
