Magnetic Components for Power Electronics Alex Goldman, 2012-12-06

Magnetic Components for Power Electronics concerns the important considerations necessary in the choice of the optimum magnetic component for power electronic applications. These include the topology of the converter circuit, the core material, shape, size, and others such as cost and potential component suppliers. These are all important for the design engineer due to the emergence of new materials, changes in supplier management, and the examples of several component choices. Suppliers using this volume will also understand the needs of designers. Highlights include emphasis on recently introduced new ferrite materials such as those operating at megahertz frequencies and under higher DC drive conditions. Discussion of amorphous and nanocrystalline metal materials. New technologies such as resonance converters, power factors correction (PFC) and soft switching. Catalog information from over 40 magnetic component suppliers. Examples of methods of component choice for ferrites, amorphous, nanocrystalline materials. Information on suppliers management changes such as those occurring at Siemens, Philips, Thomson, and Allied Signal. Attention to the increasingly important concerns about EMI. This book should be especially helpful for power electronic circuit designers, technical executives, and material science engineers involved with power electronic components.
