

Immunogenetics

- Unique features of Ig genes contd...
 - During B-cell maturation in the bone marrow, Ig gene segments are rearranged and generated into more than 10^{10} combinations of V region.
 - Each B cell has a unique combination and is antigenically committed to a specific epitope.
 - Mature B cells no longer contain identical chromosomal DNA to germ-line DNA.
 - After antigenic stimulation, further rearrangement of C-region gene segments can generate changes in isotypes without changing the specificity of Ig.
 - Genomic rearrangement is an essential feature of lymphocyte differentiation, and no other vertebrate cell type has been shown to undergo this process.

Basic Immunogenetics:

Basic Immunogenetics H. Hugh Fudenberg, 1984 This widely acclaimed text offers a comprehensive overview of the genetic principles that govern the immune system The new Third Edition covers the enormous advances in immunogenetics since publication of the Second Edition in 1978 The authors have added a new chapter on genetically determined immune deficiency states have entirely rewritten the chapter on membrane antigens and have heavily revised the section on the genetics of immunoglobulin molecules This book will continue to serve as a reliable up to date reference for all those interested in immunogenetics and as a fundamental text for graduate and undergraduate students in immunogenetics and immunochemistry *Current Catalog* National Library of Medicine (U.S.), 1979 First multi year cumulation covers six years 1965 70 *Understanding Immunology* Alastair J. Cunningham, 2012-12-02 Understanding Immunology deals with immunology and its unifying principles based on the view that the immune system has evolved to combat infectious disease This book describes the phylogenetic emergence of the immune system immune reactions in invertebrates and vertebrates antibody antigen reactions and the induction of the antibody response the development of the immune repertoire and self tolerance and memory and tolerance in T cells This text is organized into 15 chapters and begins with an overview of the immune system paying particular attention to its basic requirements and properties This book then discusses antibodies and antigens the molecular biology of antibody formation and the role of lymphocytes lymphoid tissue and antibody forming cells in the immune response The following chapters focus on immunocompetent cells and the mechanisms of cell cooperation in the induction of the antibody response properties of the cells responsible for memory and the genetic basis of antibody diversity The reader is also introduced to allelic exclusion and the ontogeny of the immune repertoire differentiation of T cells and cancer and transplantation immunology The remaining chapters explore aberrations of the immune system and immunity to infectious disease A comparison of the strategies of vertebrates and invertebrates in adapting to unexpected changes in the environment concludes the book This book will prove useful as an introduction to immunology to those with some background in biology particularly undergraduate or graduate students as well as established researchers in other fields *Human Immunogenetics* S. Surgical Research: Recent Concepts and Results Alexander Baethmann,Konrad Messmer,2012-12-06 Since surgery became a method of treating patients progress in the field has been intimately associated with experimentation and serendipitous research As in other clinical specialties advances in surgery can be considered to result from experimental attempts to increase basic knowledge and to improve technical skills However virtually in no other area do concepts and approaches of experimental research enter clinical routine as fast as in surgery There are numerous examples of this Thus allocation of manpower and resources for surgical research can be considered particularly profitable as convincingly shown for instance in renal transplantation by comparison of the long term burden of hemodialysis vs kidney grafting apart from the relief of suffering and misery Surgery is a continuously spreading field and so is surgical research This volume is a case in point Its spectrum reaches from basic molecular biological aspects of immune mechanisms to the current state of the art of pulmonary surgery of cancer metastases and from the molecular processes of cell swelling in ischemic brain edema and blood brain barrier damage to novel forms of resuscitation or of treatment of insulin dependent diabetes mellitus Surgical research faithfully reflects a constant reorientation of medical disciplines Treatment of renal or gallbladder concretions was a major domain of surgery where the introduction of extracorporeal shock wave treatment now supplies noninvasive virtually conservative alternatives *Catalog of Copyright Entries.
