may enhance a team's winning of basketball games. Results of the study for total rebounds indicated that 58 percent of the time when a team out rebounded their opponent they won the game. Offensive rebounds indicated that 49 percent of the time when a team out rebounded their opponent they won the game. Defensive rebounds showed that 70 percent of the time when a team out rebounded their opponent they won the game. Furthermore, the Gaussian distribution showed that rebounding has its greatest effect in games where rebounding was more equal between teams, center of the curve. The number of rebounds, whether offensive, defensive, or total, can be correlated to the number allowed for the defensive team. When a team plays up or down to its competition, that factor may make the difference in whether the team wins or loses, i.e., loses. Consistency and following a game plan designed to increase performance for a team or to cause greater errors in the opponent may make the difference in a game where both teams are equal rebounders. A team which is inconsistent in its rebounding means that statistics will have little effect on game outcome due to other game variables. Ultimately, the data supported the research hypothesis that the team that has a greater rebounding margin in a specific game is more likely to win.
