**Metal Promoted Selectivity in Organic Synthesis** A. Noels,M. Graziani,A.J Hubert,2012-12-06 The demand for selective organic reactions is growing more acute everyday Indeed greater product selectivity has an important impact on energy and resource utilization in terms of reduced process energy

requirements for product separation and purification in terms of low value by products and in terms of environmental acceptance and compatibility Moreover more and more chemicals especially pharmaceuticals have to be sold in an optically active form The search for selectivity constitutes a tremendous challenge for the chemists In the last two decades homogeneous transition metal based catalysis has emerged as one of the most promising tools for obtaining selectivity In connection with developments in this area this book contains updated and expanded versions of most of the lectures presented at a Cornett course held in Trieste Italy in 1989 and sponsored by the European Community A primary aim is to cultivate a deeper understanding of the parameters that govern the selectivities and stimulate a wider utilization of transition metal based catalysis in organic synthesis All aspects of selectivity chemo regio stereo and enantioselectivity are considered and illustrated by applications in various fields of organic synthesis The impact of catalysis in oxydation reduction carbonylation reactions carbene chemistry in Ni and Pd promoted dimerizations oligomerizations as well as functionalisations is stressed quite often with special emphasis laid on reaction mechanisms In this aspect the last chapter exemplifies the interest of high pressure NMR and IR when investigating the nature of reaction intermediates in homogeneous reactions
