

### Shift in dose-response curve

The standard dose response curve for a single drug is shifted to the left along the horizontal axis by the presence of a second drug.

**Drug A alone**, for example:  $ED_{50}$  Drug A = 1.9  
This is a standard sigmoid  $E_{max}$  dose-response curve.  
(e.g., Propofol for immobility)

**Drug A + Drug B** e.g.,  $ED_{50}$  Drug A = 1.0  
*in presence of drug B*  
In the presence of Drug B, dose requirements of Drug A are reduced.  
(e.g., Propofol in the presence of fentanyl 1  $\mu$ /kg at an endpoint of immobility)

### The isobologram

An isobologram is an iso-effect line whereby all the combinations of each drug along the line give the same observed effect. Multiple isobolograms can be drawn for different effect levels such as  $ED_{50}$  or  $ED_{95}$ . The doses required of each drug individually are on the X and Y axes respectively.

#### Antagonistic

Drug A increases dose of drug B to achieve the same effect  
(e.g., Naloxone and fentanyl for analgesia)

#### Infra-additive e.g., $>0.5 + >0.5 = 1$

Together the individual doses of each drug are slightly reduced to achieve the same effect  
(e.g., Ketamine and midazolam for sedation)

#### Additive e.g., $0.5 + 0.5 = 1$

Together, half the dose of each drug will achieve the same effect  
(e.g., Isoflurane and nitrous oxide for immobility)

#### Synergistic e.g., $<0.5 + <0.5 = 1$

Together, less than half the expected dose of each drug is required to achieve the same effect  
(e.g., Propofol and midazolam for hypnosis)

### The response surface

The response surface is a three dimensional graph with drugs A and B on the horizontal axes and effect on the vertical axis. The concept embraces shift in dose-response curves and the isobologram, and describes effects for the complete set of doses for the endpoint in question. Responses may be either continuous such as bispectral index and blood pressure, or quantal such as a sedation scale, awake/sleep and movement/immobility.

### The response surface

#### Dose-response curve

Drug A alone is on one axis and drug B in the other axis

#### Shift in dose response

Drug B in the presence of a constant concentration of Drug A

#### Isobologram

The 50% effect isobole is shown.  
Outward bowing of the surface indicates synergy

#### Response surface

All doses of drug A and B and their responses are shown  
(e.g., Sevoflurane and remifentanyl for immobility)

**Drug Interactions in Anesthesia** Norman Ty Smith, 1986 *Anesthetic Pharmacology* Alex S. Evers, Mervyn Maze, Evan D. Kharasch, 2011-03-10

In recent years, our understanding of molecular mechanisms of drug action and interindividual variability in drug response has grown enormously. Meanwhile, the practice of anesthesiology has expanded to the preoperative environment and numerous locations outside the OR. *Anesthetic Pharmacology: Basic Principles and Clinical Practice*, 2nd edition, is an outstanding therapeutic resource in anesthesia and critical care. Section 1 introduces the principles of drug action. Section 2 presents the molecular, cellular, and integrated physiology of the target organ, functional system, and Section 3 reviews the pharmacology and toxicology of anesthetic drugs. The new Section 4, *Therapeutics of Clinical Practice*, provides integrated and comparative pharmacology and the practical application of drugs in daily clinical practice. Edited by three highly acclaimed academic anesthetic pharmacologists with contributions from an international team of experts and illustrated in full colour, this is a sophisticated, user-friendly resource for all practitioners providing care in the perioperative period.

Modern Anesthetics Jürgen Schüttler, Helmut Schwilden, 2008-01-08

Some important constraints of anesthesia must be taken into consideration when the pharmacological properties of modern anesthetics are discussed. The most important of these could be that the target effect be achieved preferably within seconds at most within a few minutes. Similarly, offset of drug action should be achieved within minutes rather than hours. The target effects, such as unconsciousness, are potentially life-threatening, as are the side effects of modern anesthetics, such as respiratory and cardiovascular depression. Finally, the patient's purposeful responses are not available to guide drug dosage because either the patient is unconscious or, more problematically, the patient is aware but unable to communicate pain because of neuromuscular blockade. These constraints were already recognised 35 years ago when, in 1972, Volume XXX, entitled *Modern Inhalation Anesthetics*, appeared in this Handbook Series. The present volume is meant as a follow-up and extension of that

volume At the beginning of the 1970 s anesthesia was commonly delivered by inhalation with only very few exceptions The clinical understanding of that time considered anesthesia as a unique state achieved by any of the inhalation anesthetics independent of their specific molecular structure The very mechanism of anesthetic action at the biophase was discussed within the theoretical framework of the unitary theory of narcosis *Pharmacology and Physiology for Anesthesia E-Book* Hugh C. Hemmings, Talmage D.
