Question for Campus is wrong: you have to ignore all components. The previous highlighted answers for non-zero light values were wrong, when having different resistances and voltages. The two marked (3.4 ohms and 1.6V) are right but not, but have marked that the light was 0.000V when

Q1) Express the voltage across the parallel combination in terms of V_{light}

$$V_{light} = V_{parallel} = 10V$$

$$V_{light} = 10V$$

$$R_{light} = R_{parallel} = 100$$

$$R_{light} = 100 \text{ ohms}$$

$$I_{light} = I_{total} = 100$$

$$I_{light} = 100V$$

$$R_{light} = 100 \text{ ohms}$$

Q2) Express the voltage across the light in terms of V_{light}

$$V_{light} = 10V$$

Q3) Find the voltage across the light in terms of V_{light}

Assessing network structure with practical sampling methods Georgiy Bobashev,Joey Morris,Elizabeth Costenbader,Kyle Vincent,2018-05-10 Using data from an enumerated network of worldwide flight connections between airports we examine how sampling designs and sample size influence network metrics Specifically we apply three types of sampling designs simple random sampling nonrandom strategic sampling i e selection of the largest airports and a variation of snowball sampling For the latter sampling method we design what we refer to as a controlled snowball sampling design which selects nodes in a manner analogous to a respondent driven sampling design For each design we evaluate five commonly used measures of network structure and examine the percentage of total air traffic accounted for by each design The empirical application shows that 1 the random and controlled snowball sampling designs give rise to more efficient estimates of the true underlying structure and 2 the strategic sampling method can account for a greater proportion of the total number of passenger movements occurring in the network
