

Basic Soils Information

A. General Information

This section summarizes the basic soil properties and definitions required for designing pavement foundations and embankment construction. Basic soil classification and moisture-density relationships for compacted cohesive and cohesionless soil materials are included. The standard for soil density is determined as follows:

1. **Coarse-grained Soil:** The required minimum relative density and moisture range should be specified if it is a bulking soil.
2. **Fine-grained Soil:** The required minimum dry density should be specified; then the acceptable range of moisture content should be determined through which this density can be achieved.
3. **Inter-grade Soils:** The required minimum dry density or relative density should be specified, depending on the controlling test. Moisture range is determined by the controlling test.

B. Soil Types

1. **Soil:** Soils are sediments or other unconsolidated accumulation of solid particles produced by the physical and chemical disintegration of rocks, and which may or may not contain organic matter. Soil has distinct advantages as a construction material, including its relative availability, low cost, simple construction techniques, and material properties which can be modified by mixing, blending, and compaction. However, there are distinct disadvantages to the use of soil as a construction material, including its non-homogeneity, variation in properties in space and time, changes in stress-strain response with loading, erodability, weathering, and difficulties in transitions between soil and rock.

Prior to construction, engineers conduct site characterization, laboratory testing, and geotechnical analysis, design and engineering. During construction, engineers ensure that site conditions are as determined in the site characterization, provide quality control and quality assurance testing, and compare actual performance with predicted performance.

Numerous soil classification systems have been developed, including geological classification based on parent material or transportation mechanisms, agricultural classification based on particle size and fertility, and engineering classification based on particle size and engineering behavior. The purpose of engineering soil classification is to group soils with similar properties and to provide a common language by which to express general characteristics of soils.

Engineering soil classification can be done based on soil particle size and by soil plasticity. Particle size is straightforward. Soil plasticity refers to the manner in which water interacts with the soil particles. Soils are generally classified into four groups using the Unified Soil Classification System, depending on the size of the majority of the soil particles (ASTM D 3282, AASHTO M 145).

Advanced Triaxial Testing of Soil and Rock Robert T. Donaghe, Ronald C. Chaney, Marshall L. Engineering M Gidigas, 2012-12-02 Laterite Soil Engineering is one of a few books about solving engineering problems with the help of engineering pedology This book presents the latest information on the laterite soils geotechnical characteristics and engineering behavior It shows that laterite soils are different from natural soils and that most laterite soils can be evaluated for engineering purposes using accepted theories and well known test procedures for temperate zone soils This book also shows that modern concepts based on pedological considerations are very useful and take a logical approach to the identification and evaluation of laterite soils for engineering purposes The first four chapters focus on reviewing information about the processes of tropical weathering and laterization Chapter five summarizes information about the location morphology and composition of laterite soils Chapter six highlights the geotechnical implications of the pedogenic processes of tropical weathering and it emphasizes the contribution of the results of these pedogenic processes to the deviations of engineering behavior of the problem of laterite soils In addition chapter seven discusses the influence of laterite soil genesis on the physico-chemical characteristics based on comparing the properties of three genetic soil groups formed under three different weathering conditions Chapters eight through nineteen discuss the geotechnical characteristics and evaluation of laterite soils and the effects of pedogenesis and soil forming factors on the geotechnical and stabilization characteristics of laterite soils The last chapter discusses the little information that exists on the application of laterite soils in engineering problems *Analysis and Prediction of Soil Behaviour* T.
