Avraham Mayevsky, 2024-09-10 The Mongolian gerbil brain lies in the anatomy of the blood vessels supplying blood to the brain In all mammals there is a special mechanism that compensates for the decreased blood flow to the brain in the case of development of stroke This mechanism is missing in the gerbil and therefore makes the Mongolian gerbil a unique model for stroke Dr Mayevsky adopted the gerbil as a model for stroke and his laboratory uniquely studied the mitochondria in the gerbil brain under various pathophysiological conditions This book describes the history of the Mongolian gerbil in research the brain energy metabolism and mitochondrial function and brain real time monitoring systems used in gerbils as well as the brain vasculature of the Mongolian gerbil Further the book includes chapters on brain multisite recording under brain perturbations multiparametric responses to brain activation and the effect of neuroprotectants on the gerbil brain This is an ideal book for research teams researching stroke and epilepsy      **Neuraxial Therapeutics** Tony Yaksh, Salim Hayek, 2024-01-02 This book is a comprehensive reference of the neuraxial route for the delivery of therapeutics It reviews the historical evolution of this approach from its inception in the later 1800 s to present day This amply referenced text covers basic discussions of spinal anatomy embryogenesis neuraxial vascularity cerebrospinal fluid flow dynamics and parenchymal molecule movement The pharmacokinetic and pharmacodynamic properties of different intrathecal agents are explored in detail with particular reference to clinical correlates in pain and spasticity Particular attention is paid to the issues relevant to preclinical models of intrathecal delivery and the assessment of spinal pathologies arising from acute and chronic intrathecal drug delivery Chapters provide essential discussions of clinical aspects of patient care including patient evaluation and screening trialing and device management troubleshooting problems and addressing complications best practices cost effectiveness and future of the therapy Clinicians and researchers who practice intrathecal therapy and study neuraxial mechanisms will find Neuraxial Therapeutics to be an invaluable guide to this treatment modality

**The Septal Nuclei** Jon DeFrance, 2013-04-17 The septum pellucidum has been described since antiquity Even though people such as Vicq d Azyr 12 and Burdach 3 pictured the septal region in their drawings the nuclei associated with the pellucidum the septal nuclei were not described until Meynert 10 Since Meynert's description this portion of the limbic system has been troublesome in terms of nomenclature Scientists about the turn of the twentieth century proposed quite diverse terminologies For example Elliot Smith first wrote of the precommisural area 4 and then later of the paraterminal body 5 These terms however were meant to extend beyond the septal nuclei of our understanding Unger 11 and Herrick 8 proposed the familiar terms nucleus lateralis septi and nucleus medialis septi but again they were somewhat broader in definition than is accepted for current usage These terms however were rejected by Johnston 9 In Johnston's great paper he pointed out that the hippocampus seems to evolve out of large portions of the septal nuclei It was appropriate then to borrow a term previously used by Elliot Smith 6 but in another context primordium hippocampi Johnston's primordium hippocampi corresponds to the lateral septal nucleus of current usage He introduced the terms medial and lateral parolfactory area to refer to the remaining portions of the septal nuclei of Herrick 8 Hence the lateral parolfactory area refers to the nucleus accumbens septi of Ariens Kappers 2

The Cerebral Veins L.M. Auer, F. Loew, 2013-12-11 Research in the morphology angioarchitecture and ultrastructure of cerebral veins has been widely neglected in past decades investigation was mainly focussed on the arterial side of brain circulation This circumstance has certainly had a negative impact on the development of knowledge in clinical medicine about cerebral venous disease Cerebral venous pathology and its consequence is however a frequent problem in clinical neurosurgery both with regard to operative techniques and conservative management Therefore it is not surprising that the initiative to collect for the first time data on our present knowledge in basic research of cerebral veins their structure and function under normal and pathological circumstances came from clinicians Regarding the cerebral veins the clinician has primarily in view the dysfunctions originating from embryogenetic malformations phlebotic obstruction tumorous shunts or traumatic lesions But in addition to that particular attention should be paid to the microstructure of the venous vessel walls their barrier function and the venous vasomotor system Studying these interrelationships has for a long time been both fascinating and of immediate interest to me

medicine will find the treatise of interest Parts of neuroendocrinology have been discussed in other works but this is the first treatise in which an attempt has been made to cover all ramifications of neuroendocrinology This book can be used both as a text for advanced students and as a reference source Central Regulation of the Pituitary-Adrenal Complex E. V. Naumenko, 2013-03-09 This monograph gives an up to date account of the original results of the author s research in the complex field of the central control over relationships which have become established in the course of evolution between the hypothalamus and the pituitary gland The author has limited the scope of this research on logical grounds to the study of central chemically reactive structures in the regulation of the adrenal glands through the intermediary of the hypothalamo hypophyseal system Through the author s skill and expertise in the analysis of the extensive and sometimes complicated literature he has successfully undertaken a differential approach to the analysis of the concrete role of catecholamines acetylcholine and serotonin in relation to the endocrine system The vast range of experimental investigations and results of clinical observations published in the last few decades have revealed the humoral neurosecretory factors of the hypothalamus as important regulators of the principal functions of the pituitary gland and through it of the cyclic activity of the peripheral group of endocrine glands Until recently the region of the cascade of regulatory influences preceding the hypothalamus was terra incognita It is for this reason that Evgenii Vladimirovich Naumenko s monograph acquires its special importance for the neurophysiologist for its author has striven by the use of experimental methods to ascertain in detail the nature of influences which for a long time were interpreted as the general dogmas of an abstract nervism
