Oscillations in Neural Systems Daniel S. Levine,Vincent R. Brown,Timothy Shirey,1999-09 Written for those interested in designing machines to perform intelligent functions those interested in studying how these functions are performed by living organisms this bk dicusses the mathematical structure functional significance of neural oscil *Time and the Brain* Robert Miller,2003-09-02 Since the days of Galileo time has been a fundamental variable in scientific attempts to understand the natural world Once the first recordings of electrical activity in the brain had been made it became clear that electrical signals from the brain consist of very complex temporal patterns This can now be demonstrated by recordings at the single unit level and by electroencephalography EEG Time and the Brain explores modern approaches to these temporal aspects of electrical brain activity The temporal structure as revealed from trains of impulses from single nerve cells and from EEG recordings are discussed in depth together with an exploration of correlations with behaviour and psychology The single cell and EEG approaches often tend to be segregated as the research occurs in laboratories in different parts of the world By bringing together modern information acquired using both methods it is hoped that they can become better integrated as complimentary windows on the information processing achieved by the brain

Biophysically based Computational Models of Astrocyte ~ Neuron Coupling and their Functional Significance John Wade,Scott Kelso,Vincenzo Crunelli, Liam J. McDaid, Jim Harkin,2014-03-21 Neuroscientists are increasingly becoming more interested in modelling brain functions where capturing the biophysical mechanisms underpinning these functions requires plausible models at the level of neuron cells However cell level models are still very much in the embryo stage and therefore there is a need to advance the level of biological realism at the level of neurons synapses Recent publications have highlighted that astrocytes continually exchange information with multiple synapses if we are to fully appreciate this dynamic and coordinated interplay between these cells then more research on bidirectional signalling between astrocytes and neurons is required A better understanding of astrocyte neuron cell coupling would provide the building block for studying the regulatory capability of astrocytes networks on a large scale For example it is believed that local and global signalling via astrocytes underpins brain functions like synchrony learning memory and self repair This Research Topic aims to report on current research work which focuses on understanding and modelling the interaction between astrocytes and neurons at the cellular level Bottom up and at network level Top down Understanding astrocytic regulation of neural activity is crucial if we are to capture how information is represented and processed across

difficulties For example despite recent advances in multicellular recording techniques the number of neurons from which spiking activity can be simultaneously recorded remains orders magnitude smaller than the size of local networks In addition there is a lack of consensus on the distribution of pairwise spike cross correlations obtained in extracellular multi unit recordings These challenges highlight the need for theoretical and computational approaches to understand how correlations emerge and to decipher their functional role in the brain

The Relevance of the Time Domain to Neural Network

Models A. Ravishankar Rao,Guillermo A. Cecchi,2011-09-18 A significant amount of effort in neural modeling is directed towards understanding the representation of information in various parts of the brain such as cortical maps and the paths along which sensory information is processed Though the time domain is integral an integral aspect of the functioning of biological systems it has proven very challenging to incorporate the time domain effectively in neural network models A promising path that is being explored is to study the importance of synchronization in biological systems Synchronization plays a critical role in the interactions between neurons in the brain giving rise to perceptual phenomena and explaining multiple effects such as visual contour integration and the separation of superposed inputs The purpose of this book is to provide a unified view of how the time domain can be effectively employed in neural network models A first direction to consider is to deploy oscillators that model temporal firing patterns of a neuron or a group of neurons There is a growing body of research on the use of oscillatory neural networks and their ability to synchronize under the right conditions Such networks of synchronizing elements have been shown to be effective in image processing and segmentation tasks and also in solving the binding problem which is of great significance in the field of neuroscience The oscillatory neural models can be employed at multiple scales of abstraction ranging from individual neurons to groups of neurons using Wilson Cowan modeling techniques and eventually to the behavior of entire brain regions as revealed in oscillations observed in EEG recordings A second interesting direction to consider is to understand the effect of different neural network topologies on their ability to create the desired synchronization A third direction of interest is the extraction of temporal signaling patterns from brain imaging data such as EEG and fMRI Hence this Special Session is of emerging interest in the brain sciences as imaging techniques are able to resolve sufficient temporal detail to provide an insight into how the time domain is deployed in cognitive function The following broad topics will be covered in the book Synchronization phase locking behavior image processing image segmentation temporal pattern analysis EEG analysis fMRI analysis network topology and synchronizability cortical interactions involving synchronization and oscillatory neural networks This book will benefit readers interested in the topics of computational neuroscience applying neural network models to understand brain function extracting temporal information from brain imaging data and emerging techniques for image segmentation using oscillatory networks
