Lourenço,Ricardo M. F. Martins,2023-03-20 In this book innovative research using artificial neural networks ANNs is conducted to automate the sizing task of RF IC design which is used in two different steps of the automatic design process The advances in telecommunications such as the 5th generation broadband or 5G for short open doors to advances in areas such as health care education resource management transportation agriculture and many other areas Consequently there is high pressure in today s market for significant communication rates extensive bandwidths and ultralow power consumption This is where radiofrequency RF integrated circuits ICs come in hand playing a crucial role This demand stresses out the problem which resides in the remarkable difficulty of RF IC design in deep nanometric integration technologies due to their high complexity and stringent performances Given the economic pressure for high quality yet cheap electronics and challenging time to market constraints there is an urgent need for electronic design automation EDA tools to increase the RF designers productivity and improve the quality of resulting ICs In the last years the automatic sizing of RF IC blocks in deep nanometer technologies has moved toward process voltage and temperature PVT inclusive optimizations to ensure their robustness Each sizing solution is exhaustively simulated in a set of PVT corners thus pushing modern workstations capabilities to their limits Standard ANNs applications usually exploit the model s capability of describing a complex harder to describe relation between input and target data For that purpose ANNs are a mechanism to bypass the process of describing the complex underlying relations between data by feeding it a significant number of previously acquired input output data pairs that the model attempts to copy Here and firstly the ANNs disrupt from the most recent trials of replacing the simulator in the simulation based sizing with a machine deep learning model by proposing two different ANNs the first classifies the convergence of the circuit for nominal and PVT corners and the second predicts the oscillating frequencies for each case The convergence classifier CCANN and frequency guess predictor FGPANN are seamlessly integrated into the simulation based sizing loop accelerating the overall optimization process Secondly a PVT regressor that inputs the circuit s sizing and the nominal performances to estimate the PVT corner performances via multiple parallel artificial neural networks is proposed Two control phases prevent the optimization process from being misled by inaccurate performance estimates As such this book details the optimal description of the input output data relation that should be fulfilled The developed description is mainly reflected in two of the system s characteristics the shape of the input data and its incorporation in the sizing optimization loop An optimal description of these components should be such that the model should produce output data that fulfills the desired relation for the given training data once fully trained Additionally the model should be capable of efficiently generalizing the acquired knowledge in newer examples i e never seen input circuit topologies How to be a Genius DK,2022-01-06 Use your eyes ears and imagination to explore your amazing mind and sharpen your wits Want to paint like a prodigy experiment like a scientist or even invent the next new technology Put your grey matter to the brain training test and see how you measure up to some of the greatest thinkers in history Tackle brain boggling puzzles games
