Fracture and Fatigue Characterisation of Cortical Bone Tissue Marcelo F. S. F. de Moura, Nuno Dourado, 2024-09-09

Fracture and Fatigue Characterisation of Cortical Bone Tissue is a key guide to bone fracture and fatigue focusing on quasi static and fatigue fracture characterisation of cortical bone tissue. Discussing the fundamental aspects of fracture mechanics and fatigue which are applicable to many orthotropic materials, this book examines novel cutting edge approaches to analyse and model bone fracture and fatigue. As the population ages across the globe, bone fracture and fatigue has become a fundamental part of mechanical and biomedical engineering research. Beginning with a thorough description of fracture mechanics and fatigue, the book describes non linear fracture mechanics under quasi static and fatigue analyses. It goes on to present a cohesive zone modelling method which is appropriate for mode I, mode II and mixed mode I/II loading. Presenting the latest research, this book describes cutting edge fracture tests, new methods for data reduction purposes and numerical models based on cohesive zone modelling. This book is key to aiding both students and professionals in applying fundamental theories and methods to cortical bone tissue. The book will be of interest to students and professionals working in mechanical engineering and biomedical engineering including work on quasi static fracture, fracture under fatigue loading, artificial bones and fracture mechanisms.

Mechanical Design of Structural Materials in Animals John M. Gosline, 2018-05-08. Mechanical Design of Structural Materials in Animals explores the principles underlying how molecules interact to produce

the functional attributes of biological materials their strength and stiffness ability to absorb and store energy and ability to resist the fatigue that accrues through a lifetime of physical insults These attributes play a central role in determining the size and shape of animals the ways in which they can move and how they interact with their environment By showing how structural materials have been designed by evolution John Gosline sheds important light on how animals work Gosline elucidates the pertinent theories for how molecules are arranged into macromolecular structures and how those structures are then built up into whole organisms In particular Gosline develops the theory of discontinuous fiber reinforced composites which he employs in a grand synthesis to explain the properties of everything from the body wall of sea anemones to spiders silks and insect cuticles tendons ligaments and bones Although the theories are examined in depth Gosline s elegant discussion makes them accessible to anyone with an interest in the mechanics of life Focusing on the materials from which animals are constructed this book answers fundamental questions about mechanical properties in nature

Trauma - An Engineering Analysis Y.F. Al-Obaid, F.N. Bangash, T. Bangash, 2007-02-24 A number of books and research papers have been published on trauma and biomechanics They have so far not been realistically integrated The basic aim of this book is to present a unified approach between the engineering and medical professions The available engineering analyses and mathematical models can be interlinked and glued together with the medical findings by means of surgeries and X rays scans They can be translated into vastly developed computer programs predicting effects of plasticity temperature cracking and crushing with and without muscles and other interlocking phenomenon The available mathematical and engineering model on trauma and bone mechanics are then linked to the finite element analysis and to a computer program in which provisions are made to cater for all possible eventualities and medical parameters

The problems encountered by surgeries can be easily be incorporated into hybrid finite element computer programs such as PROGRAM ISOPAR used in this book In all cases studied the surgical interventions have been considered together with the bone material data for both the operational nonoperational and overloading behaviour of the human body structure In all circumstances the human body structure and its important elements were treated as composite The bone blood interaction has been incorporated in order to obtain realistic solutions Material properties in three dimensions have always been considered in throughout in various investigations Engineering analysis of trauma is being continuously developed taking into consideration the ever increasing changes in analytical design safety and manufacturing techniques The engineering advances in that direction are steadily gaining international acceptance in the wide sense of the medical profession
