A Course in Operator Theory John B. Conway, 2025-05-01 Operator theory is a significant part of many important areas of modern mathematics functional analysis differential equations index theory representation theory mathematical physics and more This text covers the central themes of operator theory presented with the excellent clarity and style that readers have come to associate with Conway's writing Early chapters introduce and review material on C^* algebras normal operators compact operators and non normal operators Some of the major topics covered are the spectral theorem the functional calculus and the Fredholm index In addition some deep connections between operator theory and analytic functions are presented Later chapters cover more advanced topics such as representations of C^* algebras compact perturbations and von Neumann algebras Major results such as the Sz Nagy Dilation Theorem the Weyl von Neumann Berg Theorem and the classification of von Neumann algebras are covered as is a treatment of Fredholm theory The last chapter gives an introduction to reflexive subspaces which along with hyperreflexive spaces are one of the more successful episodes in the modern study of asymmetric algebras Professor Conway's authoritative treatment makes this a compelling and rigorous course text suitable for graduate students who have had a standard course in functional analysis

Reinhard Honegger,Alfred Rieckers,2015-04-22 The three volume major reference Photons in Fock Space and Beyond undertakes a new mathematical and conceptual foundation of the theory of light emphasizing mesoscopic radiation systems The quantum optical notions are generalized beyond Fock representations where the richness of an infinite dimensional quantum field system with its mathematical difficulties and theoretical possibilities is fully taken into account It aims at a microscopic formulation of a mesoscopic model class which covers in principle all stages of the generation and propagation of light within a unified and well defined conceptual frame The dynamics of the interacting systems is founded according to original works of the authors on convergent perturbation series and describes the developments of the quantized microscopic as well as the classical collective degrees of freedom at the same time The achieved theoretical unification fits especially to laser and microwave applications inheriting objective information over quantum noise A special advancement is the incorporation of arbitrary multiply connected cavities where ideal conductor boundary conditions are imposed From there arises a new category of classical and quantized field parts apparently not treated in Quantum Electrodynamics before In combination with gauge theory the additional cohomological fields explain topological quantum effects in superconductivity Further applications are to be expected for optoelectronic and optomechanical systems **Animating Space** J.P.
