Unmanned Aircraft Design Mohammad H. Sadraey, 2024-09-07. This book provides fundamental principles, design procedures and design tools for unmanned aerial vehicles (UAVs) with three sections focusing on vehicle design, autopilot design and ground system design. The design of manned aircraft and the design of UAVs have some similarities and some differences. They include the design process constraints e.g. g load, pressurization and UAV main components: autopilot, ground station, communications system, sensors and payload. A UAV designer must be aware of the latest UAV developments, current technologies, know lessons learned from past failures and they should appreciate the breadth of UAV design options. The contribution of unmanned aircraft continues to expand every day and over 67 countries are developing and employing UAVs for both military and civil/scientific purposes. A UAV system is much more than a reusable air vehicle or vehicles. UAVs are air vehicles; they fly like airplanes and operate in an airplane environment. They are designed like air vehicles; they have to meet critical air vehicle requirements. A designer needs to know how to integrate complex multi-disciplinary systems and to understand the environment, the requirements and the design challenges and this book is an excellent overview of the fundamentals from an engineering perspective. This book is meant to meet the needs of newcomers into the world of UAVs. The materials are intended to provide enough information in each area and illustrate how they all play together to support the design of a complete UAV. Therefore, this book can be used both as a reference for engineers entering the field or as a supplementary text for a UAV design course to provide system level context for each specialized topic. The second edition is extensively revised. Some of the new terminologies, concepts and specific unmanned aircraft systems are introduced. The revisions make the book clearer and easier to understand and will add number of new subjects in areas that have become more prominent in the unmanned aviation world.

Propulsion Systems Alessandro Serpi, Mario Porru, 2019-10-07. The

transport sector is one of the most valuable sectors in the world. It represents the large oil consumers but still relies mainly on fossil fuels. Since the world trend in fossil fuel use is expected to increase further, a more sustainable transportation system is unavoidable to cope with emerging economic and social issues such as massive energy consumption and emissions of pollutant gases. In this regard, this book provides an overview of some recent and promising technological advancements in propulsion systems ranging from on-board components to different propulsion system architectures. In particular, the book aims at giving a brief but significant insight into propulsion system design and architecture by covering different topics and application fields: road, marine, and aerospace. *Scientific and Technical Aerospace Reports*, 1990
