Brain Function In Old Age:

Brain Function in Old Age H. P. Krause, F. Hoffmeister, C. Müller, 2012-12-06 Experimental gerontopsychology attempts to test causal hypotheses about old age related behavioral changes by the manipulation of age differences An experimental treatment is introduced with the purpose of equating different age groups with respect to a potentially relevant function If the treatment results in an assimilation of the behavior of the different age groups age by treatment interaction differences in this function are considered as causal for the normally observed behavioral difference If it does not result in an assimilation of the behavior of the different age groups main effect of treatment differences in this function are considered as irrelevant for the normally observed behavioral difference The different interpretations of age by treatment interactions and main effects of treatment in this kind of research are reasonable only if the experimental treatment actually results in an equalization of the age groups with respect to the function of interest As is shown such a functional equalization can neither be demonstrated nor assumed in many cases In such cases studies with either age group can be used to investigate hypotheses about potential causes for old age related behavioral changes studies with young subjects having important advantages over studies with old subjects A test of causal relationships by age by treatment interactions is possible in cases where the experimental treatment evidently results in an equalization of the age groups with respect to the function in question Unfortunately the field of application for this kind of approach is rather limited
