Neuropsychological Profiles and Psychometric Assessment for Healthy Aging Simone Varrasi, Sabrina Castellano, Daniele Magistro, 2025-09-26 Frailty is a multidimensional geriatric syndrome characterized by increased vulnerability to stressors

When physical frailty is associated with Mild Cognitive Impairment MCI but not dementia the definition of cognitive frailty is

preferred The use of the term cognitive frailty is based on a long series of research on the association between multimorbidity and MCI allowing for a single definition to encompass the coexistence of physical and cognitive impairment This gives useful insights on the holistic processes of aging Several aspects of cognitive frailty remain unexplored particularly in comparison to physical frailty with no consensus on its prevention functioning and measurement The lack of agreement hinders the development of effective support strategies For instance a variety of studies investigated the modifiable health and psychosocial risk factors leading to the transition to cognitive frailty nutrition sleep depression social contacts sensory impairments risky habits and so on Results are still mixed Even the neuropsychological functioning has not been thoroughly described and the definition of cognitive profiles of frailty has been left to screening tests only The need for more specific distinctive cognitive markers is closely related to the necessity for dedicated diagnostic tools However these tools are not available due to the lack of a consensus on the multidimensional concept of frailty itself which encompasses sociodemographic physical cognitive psychological nutritional social aging and disease domains Each of them should be considered in effective community dwelling based psychometric tools The ambitious goal for up to date research therefore is to address all these gaps for healthy aging
